Project Suggested by: Haoshuo Fu

## Abstract

Let  $n \geq 1$ , and let  $e$  be a regular nilpotent element of  $\mathfrak{gl}_n$ . Let  $m \geq 0$ , and consider the Slodowy slice  $S$  at the element  $(0, e) \in \mathfrak{gl}_m \times \mathfrak{gl}_n \subseteq \mathfrak{gl}_{m+n}$ . We define the *Springer fiber of  $S$*  at a nilpotent  $X \in \mathfrak{gl}_m$  as consisting of the following data: an element  $Y \in S$  which projects to  $X$  coordinate-wise, along with an element of the usual Springer fiber at  $(X, Y) \in \mathfrak{gl}_m \times \mathfrak{gl}_{m+n}$ . The main result of this paper is finding the (equidimensional) irreducible components of a Springer fiber of  $S$ . To do this, we use a well-known result classifying the irreducible components of the usual Springer fiber at a nilpotent element of  $\mathfrak{gl}_m$ . We then use our result to find the (equidimensional) irreducible components of the variety consisting of pairs  $(X, \mathcal{F})$ , where  $X \in \mathfrak{gl}_m$  is nilpotent and  $\mathcal{F}$  is an element of the Springer fiber of  $S$  at  $X$ . We conjecture that there is a correspondence, akin to the geometric RSK correspondence, between irreducible components of this last variety and certain pairs of standard Young tableaux.

# 1 Introduction

Let  $m \geq 0, n \geq 1$ , and define  $\mathfrak{g} = \mathfrak{gl}_m \times \mathfrak{gl}_{m+n}$ . Let  $\mathcal{N}$  be the nilpotent cone in  $\mathfrak{g}$ , and let  $\tilde{\mathcal{N}} \rightarrow \mathcal{N}$  be the Springer resolution.

Let  $(e, h, f)$  be a principal  $\mathfrak{sl}_2$ -triple in  $\mathfrak{gl}_n$ . Let  $(E, H, F)$  be the  $\mathfrak{sl}_2$ -triple in  $\mathfrak{gl}_{m+n}$  which is the image of  $(e, h, f)$  via the embedding  $\mathfrak{gl}_n \hookrightarrow \mathfrak{gl}_m \times \mathfrak{gl}_n \hookrightarrow \mathfrak{gl}_{m+n}$ . Let  $S$  be the Slodowy slice  $E + \mathfrak{z}_{\mathfrak{gl}_{m+n}}(F)$ . We have a map  $\mathfrak{gl}_{m+n} \rightarrow \mathfrak{gl}_m$  given by coordinate projection. Restricting to  $S$ , we obtain a projection  $p' : S \rightarrow \mathfrak{gl}_m$ . (It turns out that  $p'$  is surjective.) Then, define  $p : S \rightarrow \mathfrak{g}$  by  $x \mapsto (p'(x), x)$ . Taking the map  $p : S \rightarrow \mathfrak{g}$  and the Springer resolution  $\tilde{\mathcal{N}} \rightarrow \mathfrak{g}$ , we obtain a fibred product  $S \times_{\mathfrak{g}} \tilde{\mathcal{N}}$ . The variety  $S \times_{\mathfrak{g}} \tilde{\mathcal{N}}$  is also discussed in [2][3].

In this paper we study  $S \times_{\mathfrak{g}} \tilde{\mathcal{N}}$ . As a step towards studying  $S \times_{\mathfrak{g}} \tilde{\mathcal{N}}$ , we let  $\mathcal{N}_m$  be the nilpotent cone in  $\mathfrak{gl}_m$ , and we consider the map  $\pi : S \times_{\mathfrak{g}} \tilde{\mathcal{N}} \rightarrow \mathcal{N}_m$  given by taking the map to  $\mathfrak{g}$  and then projecting to  $\mathfrak{gl}_m$ . Given  $X \in \mathcal{N}_m$ , we call  $\pi^{-1}(X)$  the *n-Slodowy-slice Springer fiber at X*.

The main result of this paper is a classification of the irreducible components of an  $n$ -Slodowy-slice Springer fiber. Then we use this result to determine the irreducible components of  $S \times_{\mathfrak{g}} \tilde{\mathcal{N}}$ .

## 1.1 Future Work

We describe a possible extension of the result of this paper, as well as an application to representation theory.

The *Steinberg variety* of a Lie algebra  $\mathfrak{h}$  is  $\text{St}_{\mathfrak{h}} = \tilde{\mathcal{N}}_{\mathfrak{h}} \times_{\mathfrak{h}} \tilde{\mathcal{N}}_{\mathfrak{h}}$ , where the map  $\tilde{\mathcal{N}}_{\mathfrak{h}} \rightarrow \mathfrak{h}$  is the Springer resolution. There is a bijective correspondence between the Weyl group of  $\mathfrak{gl}_m$  and the set  $\text{Irr}(\text{St}_{\mathfrak{gl}_m})$  of irreducible components of  $\text{St}_{\mathfrak{gl}_m}$  (see [1][3.6] for details). The Weyl group of  $\mathfrak{gl}_m$  is the symmetric group  $S_m$ .

There is a bijection between the set of irreducible components of  $\text{St}_{\mathfrak{gl}_m}$ —which we denote by  $\text{Irr}(\text{St}_{\mathfrak{gl}_m})$ —and the set

$$T_m = \{(t_1, t_2) : \lambda \vdash m; t_1, t_2 \in \text{SYT}(\lambda)\}.$$

(We write  $\text{SYT}(\lambda)$  to denote the set of standard Young tableaux of shape  $\lambda$ .) One way to obtain the bijection is as follows. First take the aforementioned correspondence between  $\text{St}_{\mathfrak{gl}_m}$  and the Weyl group  $S_m$ . Then take the Robinson-Schensted-Knuth (RSK) correspondence, which gives a bijection between  $S_m$  and  $T_m$ . Putting these together, we get a correspondence  $\text{St}_{\mathfrak{gl}_m} \leftrightarrow T_m$ . A more direct and illuminating explanation of the correspondence  $\text{St}_{\mathfrak{gl}_m} \leftrightarrow T_m$  is given by the geometric RSK correspondence, as described in [3].

An element of  $\text{St}_{\mathfrak{gl}_m}$  is a triple  $(X, \mathfrak{b}_1, \mathfrak{b}_2)$ , where  $X \in \mathcal{N}_m$ , and  $\mathfrak{b}_1, \mathfrak{b}_2$  are elements of the Springer fiber at  $X$ . When the Jordan form of  $X$  has shape  $\lambda$ , the geometric RSK correspondence sends this triple to a pair  $(t_1, t_2)$ , where both are of shape  $\lambda$ .

Somewhat similarly, we will show that  $S \times_{\mathfrak{g}} \tilde{\mathcal{N}}$  is a subset of the set of tuples  $(X, Y, \mathfrak{b}_1, \mathfrak{b}_2)$ , where  $X \in \mathcal{N}_m, Y \in \mathcal{N}_{m+n}$ , and  $\mathfrak{b}_1$  (resp.  $\mathfrak{b}_2$ ) is an element of the Springer fiber at  $X$  (resp.  $Y$ ).

For any given relation  $R \subseteq \{\lambda : \lambda \vdash m\} \times \{\mu : \mu \vdash (m+n)\}$ , we can define

$$T_{m,n} = \{(t_1, t_2) : \lambda \vdash m; \mu \vdash (m+n); t_1 \in \text{SYT}(\lambda); t_2 \in \text{SYT}(\mu); R(\lambda, \mu)\}.$$

We conjecture that, for some appropriate choice of the relation  $R$ , there is a correspondence, analogous to  $\text{St}_{\mathfrak{gl}_m} \leftrightarrow T_m$ , between  $S \times_{\mathfrak{g}} \tilde{\mathcal{N}}$  and  $T_{m,n}$ . A natural extension of this project would explore this correspondence.

Given an element of  $\text{Irr}(\text{St}_{\mathfrak{gl}_m})$ , we can first map it to the corresponding  $(t_1, t_2) \in T_m$ , and then obtain an element of  $\text{End}(\mathbb{C}[\text{SYT}(\lambda)])$  by taking the map which sends  $t_1 \mapsto t_2$  and  $t' \mapsto 0$  for  $t' \in \text{SYT}(\lambda) \setminus \{t_1\}$ . In this way, we obtain a  $\mathbb{C}$ -algebra isomorphism

$$\mathbb{C}[\text{Irr}(\text{St}_{\mathfrak{gl}_m})] \cong \bigoplus_{\lambda \vdash m} \text{End}(\mathbb{C}[\text{SYT}(\lambda)]).$$

This is an instance of the fact that for any finite group  $G$ , we have  $\mathbb{C}[G] \cong \bigoplus_{V \in \text{IrrRep}(G)} \text{End}(V)$ .

If we had a correspondence  $S \times_{\mathfrak{g}} \tilde{\mathcal{N}} \leftrightarrow T_{m,n}$ , this could give an analogous isomorphism

$$\mathbb{C}[\text{Irr}(S \times_{\mathfrak{g}} \tilde{\mathcal{N}})] \cong \bigoplus_{(\lambda, \mu) \in R} \text{Hom}(\mathbb{C}[\text{SYT}(\lambda)], \mathbb{C}[\text{SYT}(\mu)]),$$

which would be an isomorphism of  $\mathbb{C}[S_m]$ - or  $\mathbb{C}[S_{m+n}]$ -modules rather than  $\mathbb{C}$ -algebras. (To give the RHS the structure of a  $\mathbb{C}[S_m]$ -module, we just view  $\mathbb{C}[\text{SYT}(\lambda)]$  as a representation of  $S_m$  in the standard way.)

## 1.2 Overview

Section 2 reviews some preliminary material. Section 3 finds the unique (up to similarity) principal  $\mathfrak{sl}_2$ -triple in  $\mathfrak{gl}_n$ . Section 4 embeds this  $\mathfrak{sl}_2$ -triple into

$\mathfrak{gl}_{m+n}$  as described above. We compute the Slodowy slice and end up with a nice description of  $S \times_{\mathfrak{g}} \tilde{\mathcal{N}}$ .

Section 5 discusses how to reduce the problem of finding the irreducible components of an  $n$ -Slodowy-slice Springer fiber at  $X \in \mathcal{N}_m$  to an easier problem. Section 6 solves the easier problem. Section 7 finds the irreducible components of an  $n$ -Slodowy-slice Springer fiber. Section 8 applies the results of Section 7 to find the irreducible components of  $S \times_{\mathfrak{g}} \tilde{\mathcal{N}}$ . Finally, Section 9 proves some linear algebra lemmas that were used in the paper.

### 1.3 Acknowledgments

Thank you to Haoshuo Fu for suggesting the fun project, guiding me through it, and helping me learn many things, both by talking to me about them and by suggesting things to read. Thank you also to the organizers of the MIT math department's UROP+ program, and to MIT for providing funding.

## 2 Preliminary Definitions and Facts

### 2.1 Conventions and Notations

We write  $\mathrm{GL}_m, \mathfrak{sl}_m$  to denote  $\mathrm{GL}_m(\mathbb{C}), \mathfrak{sl}_m(\mathbb{C})$ , and so on. The notation  $\mathfrak{z}_{\mathfrak{h}}(X)$  denotes the centralizer of  $X$  in the Lie algebra  $\mathfrak{h}$ .

By  $J_m$  we refer to the nilpotent  $m \times m$  Jordan block (which has ones *below* the diagonal). Given a partition  $\lambda = (\lambda_1, \dots, \lambda_\ell)$ , we write  $J(\lambda)$  to denote the block matrix

$$\begin{pmatrix} J_{\lambda_1} & & \\ & \ddots & \\ & & J_{\lambda_\ell} \end{pmatrix}.$$

A partition is always indexed in nonincreasing order, even if it is written down differently when defined. For example, if  $\mu = (4, 6, 3)$ , then  $(\mu_1, \mu_2, \mu_3) = (6, 4, 3)$ .

Throughout the paper, when a nilpotent operator  $X : \mathbb{C}^m \rightarrow \mathbb{C}^m$  of shape  $\lambda = (\lambda_1, \dots, \lambda_\ell) \vdash m$  is in the context, we write  $(e_{ij})_{1 \leq i \leq \ell, 1 \leq j \leq \lambda_i}$  to denote a Jordan basis of  $\mathbb{C}^m$  with the property that for all  $i, j$  we have  $Xe_{ij} = e_{i, j-1}$ . (By convention,  $e_{ij} := 0$  for  $j < 1$ , so that condition makes sense.) Also, we write  $f_n, \dots, f_1$  to denote the basis of  $\mathbb{C}^n$  with the property that  $J_n f_i = f_{i-1}$ .

## 2.2 Springer Fibers

Let  $\mathfrak{h}$  be a Lie algebra, let  $\mathcal{N}_{\mathfrak{h}} \subseteq \mathfrak{h}$  be the nilpotent cone in  $\mathfrak{h}$ , and let  $\mathcal{B}_{\mathfrak{h}}$  be the variety of Borel subalgebras of  $\mathfrak{h}$ . Let  $\tilde{\mathcal{N}}_{\mathfrak{h}} = \{(\mathfrak{b}, n) \in \mathcal{B}_{\mathfrak{h}} \times \mathcal{N}_{\mathfrak{h}} : n \in \mathfrak{b}\}$ . Let  $\pi_{\mathfrak{h}} : \tilde{\mathcal{N}}_{\mathfrak{h}} \rightarrow \mathcal{N}_{\mathfrak{h}}$  be the projection onto the second coordinate. We call  $\pi_{\mathfrak{h}}$  the *Springer resolution*. For  $n \in \mathcal{N}_{\mathfrak{h}}$ , we call  $\pi_{\mathfrak{h}}^{-1}(n)$  the *Springer fiber at  $n$* .

## 2.3 Springer Fibers in $\mathfrak{gl}_m$

Let  $\mathcal{N}_m$  be the nilpotent cone in  $\mathfrak{gl}_m$ , and let  $\mathcal{B}_m$  be the variety of Borel subalgebras of  $\mathfrak{gl}_m$ . Let  $\mathfrak{h} \subseteq \mathfrak{gl}_m$  be the subalgebra of upper triangular matrices. The variety of Borel subalgebras of  $\mathfrak{gl}_m$  is  $\mathcal{B}_m = \{g\mathfrak{h}g^{-1} : g \in \mathrm{GL}_m\}$ . Thus, the Springer fiber at  $X \in \mathcal{N}_m$  is

$$\mathcal{F}_X = \{g\mathfrak{h}g^{-1} : g \in \mathrm{GL}_m; X \in g\mathfrak{h}g^{-1}\}.$$

**Definition 2.1.** A flag  $V_{\bullet}$  of  $\mathbb{C}^m$  is a sequence of subspaces

$$0 = V_0 \subseteq V_1 \subseteq \cdots \subseteq V_m = \mathbb{C}^m,$$

where  $\dim V_i = i$ .

We say that  $X \in \mathfrak{gl}_m$  preserves a flag  $V_{\bullet}$  if for each  $i$  we have  $XV_i \subseteq V_i$ . For  $X \in \mathfrak{gl}_m$ , we have  $[X \in \mathcal{N}_m, \text{ and } X \text{ preserves } V_{\bullet}]$  if and only if [for all  $i$ ,  $XV_{i+1} \subseteq V_i$ ].

One flag is the *standard flag*  $E_{\bullet}$ , where  $E_i$  is generated by the first  $i$  standard basis vectors. The subalgebra  $\mathfrak{h}$  is exactly the subset of  $\mathfrak{gl}_m$  which preserves  $E_{\bullet}$ . So, we can think of  $\mathcal{B}_m$  as the variety of flags of  $\mathbb{C}^m$ , via the correspondence

$$g\mathfrak{h}g^{-1} \leftrightarrow g \cdot E_{\bullet}.$$

( $\mathrm{GL}_m$  acts on the set of flags via  $(g \cdot V_{\bullet})_j := gV_j$ .) Note that  $X$  preserves  $g \cdot E_{\bullet}$  if and only if  $X \in g\mathfrak{h}g^{-1}$ . Thus, we may write the Springer fiber at  $X$  in terms of flags, as

$$\mathcal{F}_X = \{g \cdot E_{\bullet} : g \in \mathrm{GL}_m; X \in g\mathfrak{h}g^{-1}\} = \{V_{\bullet} : \forall i. XV_{i+1} \subseteq V_i\}.$$

**Theorem 2.2** ([4, 2.1]). *The irreducible components of the Springer fiber at  $J(\mu)$  are in bijection with the standard Young tableaux of shape  $\mu$ . The irreducible components are equidimensional, of dimension  $\sum_{i < j} \min(\mu_i, \mu_j) = \sum_i (i-1)\mu_i$ .*

## 2.4 Slodowy Slices

A basis for  $\mathfrak{sl}_2$  is

$$e' := \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}, h' := \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix}, f' := \begin{pmatrix} 0 & 0 \\ 1 & 0 \end{pmatrix}.$$

Given a Lie algebra  $\mathfrak{h}$  and a homomorphism  $\phi : \mathfrak{sl}_2 \rightarrow \mathfrak{h}$  sending  $(e', h', f')$  to  $(e, h, f)$ , we say that  $(e, h, f)$  is an  $\mathfrak{sl}_2$ -triple. If  $\mathfrak{h}$  is semisimple, then given any nilpotent  $e \in \mathfrak{h}$ , the Jacobson-Morozov theorem [1, 3.7.1] says that there exist  $h, f \in \mathfrak{h}$  such that  $(e, h, f)$  is an  $\mathfrak{sl}_2$ -triple.

Given  $(e, h, f)$ , we define the *Slodowy slice at  $e$*  as  $S_e = e + \mathfrak{z}_{\mathfrak{h}}(f)$ . By the Jacobson-Morozov theorem, if  $\mathfrak{h}$  is semisimple, then we can always find a Slodowy slice at any nilpotent  $e \in \mathfrak{h}$ . In particular, we can find a Slodowy slice at any nilpotent  $e \in \mathfrak{gl}_n$ , since  $\mathfrak{sl}_n \subseteq \mathfrak{gl}_n$  is semisimple and contains every nilpotent element of  $\mathfrak{gl}_n$ .

## 3 Principal $\mathfrak{sl}_2$ -triples in $\mathfrak{gl}_n$

The unique nilpotent regular element of  $\mathfrak{gl}_n$  (up to similarity) is  $J_n$ . In this section we show that, in fact, there is a unique (up to similarity) principal  $\mathfrak{sl}_2$ -triple in  $\mathfrak{gl}_n$ . Let  $e = J_n$ .

**Lemma 3.1.** *There is exactly one way to choose  $h, f \in \mathfrak{gl}_n$  so that  $(e, h, f)$  is an  $\mathfrak{sl}_2$ -triple.*

*Proof.* Note that  $[h', e'] = 2e'$ , and  $[e', f'] = h'$ , and  $[h', f'] = -2f'$ . Thus  $e, h, f$  must obey the same relations. In particular,  $he - eh = 2e$ . The matrix  $eh$  is  $h$  shifted down one, and  $he$  is  $h$  shifted left one. So,  $[h, e] = 2e$  implies that  $h_{ij} = 0$ , except when  $i = j$  or  $(i, j) = (n, 1)$ . It also implies that  $h_{ii} = h_{i-1, i-1} + 2$ , and hence  $h_{ii} = h_{11} + 2(i - 1)$ .

Similarly,  $ef - fe = h$ ; this implies that  $f_{ij} = 0$ , except when  $j = i + 1$  or  $(i, j) = (n, 1)$ . Also,  $f_{i, i+1} = f_{i+1, i+2} + h_{i+1, i+1}$ , and  $f_{1, 2} = -h_{1, 1}$ , and

$f_{n-1,n} = h_{n,n}$ . Putting these equations together,

$$\begin{aligned} h_{nn} + h_{11} &= \\ f_{n-1,n} - f_{1,2} &= \\ \sum_{i=1}^{n-2} (f_{i+1,i+2} - f_{i,i+1}) &= \\ - \sum_{i=1}^{n-2} h_{i+1,i+1}. \end{aligned}$$

That is,  $h \in \mathfrak{sl}_n$ . This shows that  $h_{11} = 1 - n, h_{22} = 3 - n, \dots, h_{nn} = n - 1$ .

Now that we have mostly determined  $h$  and  $f$ , looking at  $[e, f] = h$  and  $[h, f] = -2f$  shows that  $h_{n,1} = f_{n,1} = 0$ . So we have determined  $h$ ; it is

$$h = \begin{pmatrix} 1-n & & & & \\ & 3-n & & & \\ & & \ddots & & \\ & & & n-3 & \\ & & & & n-1 \end{pmatrix}.$$

Now, we can use our expression for  $f$  in terms of  $h$  to obtain

$$\begin{aligned} f &= \begin{pmatrix} 0 & n-1 & & & \\ & 0 & (n-1) + (n-3) & & \\ & & \ddots & \ddots & \\ & & & 0 & (n-1) + \dots + (3-n) \\ & & & & 0 \end{pmatrix} = \\ &\begin{pmatrix} 0 & (1)(n-1) & & & \\ & 0 & (2)(n-2) & & \\ & & \ddots & \ddots & \\ & & & 0 & (-2)(n-2) \\ & & & & 0 & (-1)(n-1) \\ & & & & & 0 \end{pmatrix}. \end{aligned}$$

□

## 4 Finding $S \times_{\mathfrak{g}} \tilde{\mathcal{N}}$

### 4.1 Finding the Slodowy Slice $S$

In the previous section we computed the principal  $\mathfrak{sl}_2$ -triple  $(e, h, f)$  in  $\mathfrak{gl}_n$ . Embedding this into  $\mathfrak{gl}_{m+n}$  as described previously, we obtain

$$(E, H, F) = \left( \begin{pmatrix} 0 & 0 \\ 0 & e \end{pmatrix}, \begin{pmatrix} 0 & 0 \\ 0 & h \end{pmatrix}, \begin{pmatrix} 0 & 0 \\ 0 & f \end{pmatrix} \right).$$

**Lemma 4.1.**  $\mathfrak{z}_{\mathfrak{gl}_n}(f)$  is the set of upper-triangular  $X \in \mathfrak{gl}_n$  such that for all  $i, j$ ,

$$X_{i+1,j+1} = \frac{j(n-j)}{i(n-i)} X_{ij}.$$

*Proof.* Let  $X \in \mathfrak{z}_{\mathfrak{gl}_n}(f)$ . Looking at the definition of  $f$  from the previous section (and zero-padding the matrices), we see that  $(fX)_{ij} = i(n-i)X_{i+1,j}$ , and  $(Xf)_{ij} = (j-1)(n-(j-1))X_{i,j-1}$ . So,

$$\forall i, j \in \{1, \dots, n\}. i(n-i)X_{i+1,j} = (j-1)(n-(j-1))X_{i,j-1}.$$

Taking  $j = 1$ , the condition above tells us that  $\forall i \geq 2. X_{i,1} = 0$ . Taking  $j > 1$  and  $i < n$ , we obtain that

$$\forall i, j \in \{1, \dots, n-1\}. X_{i+1,j+1} = \frac{j(n-j)}{i(n-i)} X_{ij}.$$

So, every  $X \in \mathfrak{z}_{\mathfrak{gl}_n}(f)$  is upper triangular and satisfies the condition above. Conversely, it is clear that for such  $X$  we have  $fX = Xf$ .  $\square$

**Lemma 4.2.**

$$\mathfrak{z}_{\mathfrak{gl}_{m+n}}(F) = \left\{ \left( \begin{array}{c|c} X & \begin{array}{c} | \\ b \\ | \end{array} \\ \hline \begin{array}{c} - & a & - \end{array} & Y \end{array} \right) : X \in \mathfrak{gl}_m; Y \in \mathfrak{z}_{\mathfrak{gl}_n}(f); a, b \in \mathbb{C}^m \right\}.$$

*Proof.* Let  $Z = \begin{pmatrix} Z_{11} & Z_{12} \\ Z_{21} & Z_{22} \end{pmatrix} \in \mathfrak{z}_{m+n}(F)$ . We have

$$\begin{pmatrix} 0 & Z_{12}f \\ 0 & Z_{22}f \end{pmatrix} = ZF = FZ = \begin{pmatrix} 0 & 0 \\ fZ_{21} & fZ_{22} \end{pmatrix}.$$

There is no restriction on  $Z_{11}$ . The condition  $Z_{12}f = 0$  means that all but the last column of  $Z_{12}$  must be zero, and the condition  $0 = fZ_{21}$  means that all but the first row of  $Z_{21}$  must be zero. And the condition  $Z_{22}f = fZ_{22}$  means that  $Z_{22} \in \mathfrak{z}_{\mathfrak{gl}_{m+n}}(f)$ .  $\square$

These lemmas provide an explicit characterization of the Slodowy slice  $S = E + \mathfrak{z}_{\mathfrak{gl}_{m+n}}(F)$ .

**Corollary 4.3.**

$$S = \left\{ \left( \begin{array}{ccc|c} & & & b \\ & X & & \\ \hline - & a & - & \\ \hline & & & e + Y \end{array} \right) : a, b \in \mathbb{C}^m, X \in \mathfrak{gl}_m, Y \in \mathfrak{z}_{\mathfrak{gl}_n}(f) \right\}.$$

## 4.2 A description of $S \times_{\mathfrak{g}} \tilde{\mathcal{N}}$

Recall that we have the map  $S \rightarrow \mathfrak{g}$  given by  $Z \mapsto (p(Z), Z)$ , where  $p : \mathfrak{gl}_{m+n} \rightarrow \mathfrak{gl}_m$  is the coordinate projection. We also have the Springer resolution  $\tilde{\mathcal{N}} \rightarrow \mathfrak{g}$ . From these two maps we define the fibered product  $S \times_{\mathfrak{g}} \tilde{\mathcal{N}}$ .

To obtain an explicit description of  $S \times_{\mathfrak{g}} \tilde{\mathcal{N}}$ , we will begin by finding the image of the projection  $S \times_{\mathfrak{g}} \tilde{\mathcal{N}} \rightarrow S$ . As the image of the Springer resolution is  $\mathcal{N} = \mathcal{N}_m \times \mathcal{N}_{m+n}$ , the image of the projection  $S \times_{\mathfrak{g}} \tilde{\mathcal{N}} \rightarrow S$  is simply  $S' = \{Z \in S : p(Z) \in \mathcal{N}_m, Z \in \mathcal{N}_{m+n}\}$ .

**Lemma 4.4.**

$$S' = \left\{ A_{X,a,b} := \left( \begin{array}{ccc|cccc} & & & & & \\ & X & & & & b \\ \hline - & a & - & 0 & & \\ & & & 1 & 0 & \\ & & & & \ddots & \ddots \\ & & & & & 1 & 0 \end{array} \right) \in \mathcal{N}_{m+n} : a, b \in \mathbb{C}^m, X \in \mathcal{N}_m \right\}.$$

*Proof.* As every element of  $\mathfrak{z}_{\mathfrak{gl}_n}(f)$  is upper triangular, Corollary 9.10 tells us that if a matrix of the form given in Corollary 4.3 is nilpotent, and the upper-left block  $X$  is nilpotent as well, then  $e + Y$  must be nilpotent. Then, again using that every element  $Y \in \mathfrak{z}_{\mathfrak{gl}_n}(f)$  is upper triangular, Lemma 9.8 tells us that if  $e + Y$  is nilpotent, then  $Y = 0$ .

Hence every element of  $S'$  must simply have  $e$  in its bottom-right block. So, every element of  $S'$  is of the desired form.  $\square$

This is not a fully explicit characterization of  $S'$ , since we don't say which choices of  $X$  and  $a, b \in \mathbb{C}^m$  lead to  $A_{X,a,b}$  being nilpotent. We could use Lemma 9.9 to find a necessary and sufficient condition on  $X, a, b$ ; however, the description above of  $S'$  will be good enough for our purposes.

**Corollary 4.5.**

$$\begin{aligned} S \times_{\mathfrak{g}} \tilde{\mathcal{N}} = \\ \{((X, A_{X,a,b}), ((X, A_{X,a,b}), \mathfrak{b})) : \mathfrak{b} \in \mathcal{B}, (X, A_{X,a,b}) \in \mathcal{N} \cap \mathfrak{b}\} \cong \\ \{(A_{X,a,b}, \mathfrak{b}) : \mathfrak{b} \in \mathcal{B}, (X, A_{X,a,b}) \in \mathfrak{b} \cap \mathcal{N}\}. \end{aligned}$$

We have a map  $\pi : S \times_{\mathfrak{g}} \tilde{\mathcal{N}} \rightarrow \mathcal{N}_m$  given by  $(A_{X,a,b}, \mathfrak{b}) \mapsto X$ . We define the *n-Slodowy-slice Springer fiber* at  $X \in \mathcal{N}_m$  to be the fiber  $\pi^{-1}(X)$ . Because  $\mathcal{B} = \mathcal{B}_m \times \mathcal{B}_{m+n}$ ,

$$\pi^{-1}(X) \cong \{(A_{X,a,b}, \mathfrak{b}_{m+n}) : A_{X,a,b} \in \mathfrak{b}_{m+n} \cap \mathcal{N}_{m+n}\} \times \{\mathfrak{b}_m : X \in \mathfrak{b}_m\}.$$

The right factor of the product is simply the usual Springer fiber at  $X$ .

Let

$$\mathcal{P}_X = \{(A_{X,a,b}, (V_i)) : \forall i. A_{X,a,b} V_i \subseteq V_{i-1}\}.$$

Using our correspondence between Springer fibers in  $\mathcal{B}_{m+n}$  and flags of  $\mathbb{C}^{m+n}$ , we see that  $\mathcal{P}_X$  is isomorphic to the left factor of  $\pi^{-1}(X)$ . In the next few sections, we will find the irreducible components of  $\mathcal{P}_X$ . Then we will use this, along with the result about the usual Springer fiber at  $X$ , to find the irreducible components of  $\pi^{-1}(X)$  and then of  $S \times_{\mathfrak{g}} \tilde{\mathcal{N}}$ .

## 5 Strategy for finding components of $\mathcal{P}_{J(\lambda)}$

Let  $X = J(\lambda) \in \mathfrak{gl}_m$ , where  $\lambda = (\lambda_1, \dots, \lambda_k)$ . In this section we write  $\mathcal{P} := \mathcal{P}_{J(\lambda)}$  and  $A_{a,b} := A_{J(\lambda),a,b}$ . Let  $(e_{ij})_{1 \leq i \leq k, 1 \leq j \leq \lambda_i}$  be the standard basis for  $\mathbb{C}^m$ .

For convenience we write  $e_{ij} := 0$  for  $j < 1$ ; now we may express the fact that  $(e_{ij})$  is a Jordan basis by writing  $\forall i. X e_{ij} = e_{i,j-1}$ .

In this section we begin finding the irreducible components of

$$\mathcal{P} = \{(A_{a,b}, (V_i)) : \forall i. A_{a,b} V_{i+1} \subseteq V_i\}.$$

For  $1 \leq w \leq k$  and  $0 \leq r \leq \lambda_w$  (note that we allow  $r = 0$ ), define

$$\mathcal{P}_{w,r} := \{(A_{a,b}, V) \in \mathcal{P} : \exists P \in \text{GL}_m. \exists b'. (P^{-1}, I_n) A_{a,b} (P, I_n) = A_{e_{wr}, b'}\}.$$

**Lemma 5.1.**  $\mathcal{P} = \bigcup_{1 \leq w \leq k, 0 \leq r \leq \lambda_w} \mathcal{P}_{wr}$ .

*Proof.* For any  $a \in \mathbb{C}^m$ , define  $f_a : \mathbb{C}^{m+n} \rightarrow \mathbb{C}$  by  $e_{ij} \mapsto a_{ij}$  and  $f_i \mapsto 0$ . For this proof we take the coordinate-free view of  $A_{a,b}$  as the linear transformation  $\mathbb{C}^{m+n} \rightarrow \mathbb{C}^{m+n}$  that sends  $e_{ij}$  to  $e_{i,j-1} + f_a(e_{ij})f_n$ , sends  $f_{i+1}$  to  $f_i$ , and sends  $f_1$  to  $(b, 0)$ .

Let  $(A_{a,b}, (V_i)) \in \mathcal{P}$ . Since  $X$  is nilpotent, Theorem 9.7 says that there is a change of basis  $P : \mathbb{C}^m \rightarrow \mathbb{C}^m$  such that  $P e_{ij}$  forms a Jordan basis for  $X$ , and for all but one pair  $(i, j)$  we have  $f(P e_{ij}) = 0$ .

Now let  $Q = (P^{-1}, I_n) A_{a,b} (P, I_n)$ . Since  $P e_{ij}$  is a Jordan basis, we have  $Q = A_{a', b'}$  for some  $a', b' \in \mathbb{C}^m$ . All that is left is to show that  $a'$  is of the form  $e_{wr}$  for some  $w$  and  $r$ . Indeed, this results from the fact that  $f_{a'}(e_{ij}) = f_a(P e_{ij}) = 0$  for all but one pair  $(i, j)$ .  $\square$

**Lemma 5.2.**  $\mathcal{P}_{w_1 r_1} = \mathcal{P}_{w_2 r_2}$  exactly when either  $r_1 = r_2 = 0$ , or  $(\lambda_{w_1}, r_1) = (\lambda_{w_2}, r_2)$ .

*Proof.* If  $r_1 = r_2 = 0$ , we have  $e_{w_1 r_1} = e_{w_2 r_2} = 0$ , so clearly  $\mathcal{P}_{w_1 r_1} = \mathcal{P}_{w_2 r_2}$ . And if  $(\lambda_{w_1}, r_1) = (\lambda_{w_2}, r_2)$ , then clearly any matrix of the form  $A_{e_{w_1 r_1}, b'}$  can be transformed to a matrix of the form  $A_{e_{w_2 r_2}, b'}$  by making the change of basis that swaps  $e_{w_1 j}$  with  $e_{w_2 j}$ .

Conversely, suppose  $\mathcal{P}_{w_1 r_1} = \mathcal{P}_{w_2 r_2}$ . Let  $k \geq 0$  be minimal so that  $A_{e_{w_1 r_1}, 0} f_1 \neq 0$ . Obviously  $k = r_1$ . Since  $A_{e_{w_1 r_1}, 0}$  and  $A_{e_{w_2 r_2}, 0}$  differ only by a change of basis of  $\mathbb{C}^m$ , the same reasoning shows that  $k = r_2$ . Hence  $r_1 = r_2$ . Now, if  $r_1 = 0$ , we are done.

Otherwise, we have  $r_1 > 0$ . Let  $k' \geq 0$  be maximal so that  $\exists v \in \mathbb{C}^m. A_{e_{w_1 r_1}, 0}^{k'} v = A_{e_{w_1 r_1}, 0} f_1$ . Obviously  $k' = \lambda_{w_1} - r_1$ . Clearly  $k'$  is independent of  $\mathbb{C}^m$ -basis, so we see that  $\lambda_{w_1} - r_1 = k' = \lambda_{w_2} - r_2$ .  $\square$

**Lemma 5.3.** When  $\mathcal{P}_{w_1 r_1} \neq \mathcal{P}_{w_2 r_2}$ , we have  $\mathcal{P}_{w_1 r_1} \cap \mathcal{P}_{w_2 r_2} = \emptyset$ .

*Proof.* It suffices to remark that  $\{(x, y) : \exists w, r. x, y \in \mathcal{P}_{wr}\}$  is an equivalence relation. Reflexivity is the statement of Lemma 5.1, and associativity and transitivity are obvious from the definition of  $\mathcal{P}_{wr}$ .  $\square$

Now, fix any  $w$  and  $r$ . We will find the irreducible components of  $\mathcal{P}_{w,r}$ . These will all happen to be equidimensional (with dimensions independent of  $w$  and  $r$ ), so their closures in  $\mathcal{P}$  will be the irreducible components of  $\mathcal{P}$ .

Let

$$G := \{P \in \mathrm{GL}_m : P^{-1}XP = X\},$$

and

$$G_{wr} = \{A \in G : e_{wr}A = e_{wr}\}.$$

Now, define

$$\mathcal{Q}_{wr} = \{(A_{e_{wr},b}, (V_i)) \in \mathcal{P}_{wr}\}.$$

Let  $G$  act on  $\mathcal{P}_{wr}$  by

$$P \cdot (A_{e_{wr},b}, (V_i)) := ((P, I_n)A_{e_{wr},b}(P, I_n)^{-1}, (P, I_n)(V_i)) = (A_{e_{wr}P^{-1}, Pb}, (P, I_n)(V_i)).$$

Note that for any  $x \in \mathcal{Q}_{wr}$ , we have  $G_{wr} = \{g \in G : g \cdot x \in \mathcal{Q}_{wr}\}$ . So, by restriction of  $G$  to  $G_{wr}$  and  $\mathcal{P}_{wr}$  to  $\mathcal{Q}_{wr}$ , we obtain an action of  $G_{wr}$  on  $\mathcal{Q}_{wr}$ .

Consider the map  $\varphi : \mathcal{Q}_{wr} \times G \rightarrow \mathcal{P}_{wr}$  defined by

$$(x, P) \mapsto P \cdot x.$$

Then, letting  $G_{wr}$  act on  $G$  by  $g \cdot h := hg^{-1}$ , we obtain an action of  $G_{wr}$  on  $\mathcal{Q}_{wr} \times G$ .

**Lemma 5.4.** *The map  $\varphi$  is a principal  $G_{wr}$ -bundle.*

*Proof.* We need to show that  $G_{wr}$  acts freely and transitively on the fibers of  $\varphi$ . It is obvious that  $G_{wr}$  acts freely on  $\mathcal{Q}_{wr} \times G$ ; it is enough to note that it acts freely on  $G$ .

Let  $y \in \mathcal{P}_{wr}$ . By definition of  $\mathcal{P}_{wr}$ , there is  $P_y \in G$  with  $P_y \cdot y \in \mathcal{Q}_{wr}$ . We have

$$\begin{aligned} \varphi^{-1}(y) &= \{(x, P) : P \cdot x = y\} = \\ &= \{(P^{-1}y, P) : P^{-1}y \in \mathcal{Q}_{wr}\} = \\ &= \{((P^{-1}P_y^{-1}) \cdot (P_y \cdot y), P) : (P^{-1}P_y^{-1}) \cdot (P_y \cdot y) \in \mathcal{Q}_{wr}\}. \end{aligned}$$

Using that  $G_{wr} = \{g \in G : g \cdot (P_y \cdot y) = P_y \cdot y\}$ , the expression above becomes

$$\{((P^{-1}P_y^{-1}) \cdot (P_y \cdot y), P) : (P^{-1}P_y^{-1}) \in G_{wr}\}.$$

Setting  $Q := P^{-1}P_y^{-1}$ , so that  $P = P_y^{-1}Q^{-1}$ , the above becomes

$$\begin{aligned} \{(Q \cdot (P_y \cdot y), P_y^{-1}Q^{-1}) : Q \in G_{wr}\} = \\ \{Q \cdot (P_y \cdot y, P_y^{-1}) : Q \in G_{wr}\}. \end{aligned}$$

Thus the fibers are exactly the  $G_{wr}$ -orbits; or in other words,  $G_{wr}$  acts transitively on the fibers, as desired.  $\square$

Our strategy is to find the irreducible components  $X \subseteq \mathcal{Q}_{wr}$ , and we will then argue that the irreducible components of  $\mathcal{P}_{wr}$  are of the form  $\varphi(X \times G)$ . So, we will now find the irreducible components of  $\mathcal{Q}_{wr}$ .

Actually  $\mathcal{Q}_{wr}$  might be unnecessarily difficult to think about; it is easiest in the case  $r = 0$ . So, we will change basis to make  $r = 0$ . Let  $m' = m - r$ , and  $n' = n + r$ . Let  $\lambda' = (\lambda_1, \dots, \lambda_{w-1}, \lambda_w - r, \lambda_{w+1}, \dots, \lambda_k)$ . Let  $X' = J(\lambda)$ . (TODO: explain that  $A'$  is like  $A$ , but with  $m', n'$  taking the place of  $m, n$ .) Let  $\mathcal{Q}' = \{(A'_{X',0,b}, (V_i)) : \forall i. A_{X',0,b}V_{i+1} \subseteq V_i\}$ .

**Lemma 5.5.**  $\mathcal{Q}_{wr} \cong \mathcal{Q}'$

*Proof.* Let  $e'_{ij}$  be the standard Jordan basis for  $X'$ . Let  $f'_1, \dots, f'_{n'}$  be a basis for  $\mathbb{C}^{n'}$ , with  $A_{X',0,b}f'_{i+1} = f'_i$ , and  $A_{X',0,b}f'_1 = (b, 0)$ . Set  $m' := m - r$ , and  $n' := n + r$ . Define the linear map  $Q_{wr} : \mathbb{C}^{m'+n'} \rightarrow \mathbb{C}^{m+n}$  by:

- For all  $i$ ,  $e'_{ij} \mapsto e_{ij}$ .
- For  $j = 1, \dots, r$ ,  $f'_{n+j} \mapsto e_{w,(\lambda_w-r)+j}$ .
- For  $j = 1, \dots, n$ ,  $f'_j \mapsto f_j + e_{w,(\lambda_w-r)-n+j}$ .

Change of basis by  $Q_{wr}$  maps  $\mathcal{Q}_{wr}$  to  $\mathcal{Q}'$ , and conjugation by  $Q_{wr}^{-1}$  maps  $\mathcal{Q}'$  to  $\mathcal{Q}_{wr}$ .  $\square$

The next section finds the irreducible components of  $\mathcal{Q}'$ . To avoid death by primes, we will refer to it as  $\mathcal{Q}$ , and refer to  $m', n'$  as  $m, n$ , and so on, throughout the next section.

## 6 The components of $\mathcal{Q}$

### 6.1 Setup

Let  $X = J(\lambda) \in \mathfrak{gl}_m$ . Let  $(e_{ij})_{1 \leq i \leq k, 1 \leq j \leq \lambda_i}$  be the standard (Jordan) basis for  $\mathbb{C}^m$ . Let

$$\mathcal{Q} = \{(A_{0,b}, (V_i)) : \forall i. A_{0,b}V_{i+1} \subseteq V_i\}.$$

In this section we find the irreducible components of  $\mathcal{Q}$ .

We write  $b_{ij}$  to denote the projection of  $b \in \mathbb{C}^m$  onto  $e_{ij}$ . For each row  $i$ , let  $p_i(b) = \max\{j : b_{ij} \neq 0\}$  (the maximum of the empty set is zero). Then set  $q_i(b) = \lambda_i - p_i(b)$ . When it is clear enough from context where the  $b$  is coming from, we will just write  $p_i$  and  $q_i$  instead of  $p_i(b)$  and  $q_i(b)$ .

Let  $I = \{i_1 < \dots < i_r\} \subseteq \{1, \dots, k\}$ , and let  $(\rho_i)_{i \in I}$  be any map  $I \rightarrow \mathbb{N}_{>0}$  such that (1)  $\rho_i \leq \lambda_i$ , (2)  $\rho_i$  is decreasing with  $i$ , (3)  $\lambda_i - \rho_i$  is decreasing with  $i$ , and (4)  $\rho_i < n$ . For notational convenience (although we assign meaning to neither  $i_0$  nor  $i_{r+1}$ ), we define  $q_{i_0} := n$ , and  $p_{i_{r+1}} := 0$ . Then, we define  $B_{I,(\rho_i)}$  as the set of  $b \in \mathbb{C}^m$  satisfying the following conditions.

- For all  $k \in \{1, \dots, r\}$ ,  $p_i = \rho_i$ .
- For all  $k \in \{0, \dots, r\}$ ,  $p_{i_{k+1}} = \max_{i: q_i < q_{i_k}} p_i$ .

Note that for any  $b \in B_{I,(\rho_i)}$  we have  $p_{i_1} > \dots > p_{i_r} > p_{i_{r+1}}$ , and also  $q_{i_0} > q_{i_1} > \dots > q_{i_r}$ .

**Lemma 6.1.**  $\mathbb{C}^m = \bigcup_{I,(\rho_i)} B_{I,(\rho_i)}$ , where  $I$  ranges over all subsets of  $\{1, \dots, k\}$ , and  $(\rho_i)$  ranges over all maps  $I \rightarrow \mathbb{N}_{>0}$  satisfying the conditions (1),(2),(3),(4). Further, none of the  $B_{I,(\rho_i)}$  is contained in the union of the others.

*Proof.* Let  $b \in \mathbb{C}^m$ . If  $\{i : q_{i_0} > q_i\}$  is the empty set, then stop. Otherwise, take any  $i_1 \in \arg \max_{i: q_{i_0} > q_i} p_i$ , and set  $\rho_{i_1} := p_{i_1}$ . If  $\{i : q_{i_1} > q_i\} = \emptyset$ , then stop. Otherwise, take any  $i_2 \in \arg \max_{i: q_{i_1} > q_i} p_i$ , and set  $\rho_{i_2} := p_{i_2}$ . Continuing on in this way, eventually we reach a  $k$  where  $\{i : q_{i_k} > q_i\} = \emptyset$ . Then we set  $I = \{i_1, \dots, i_k\}$ . Note that  $I, (\rho_i)$  satisfy conditions (1)–(4), and furthermore  $b \in B_{I,(\rho_i)}$ .

Now, we check that no  $B_{I,(\rho_i)}$  is contained in the union of the others. Fix  $I$  and  $(\rho_i)$ . Take any  $b \in B_{I,(\rho_i)}$  with  $p_i = \rho_i$  for  $i \in I$  and  $p_i = 0$  for  $i \notin I$ . It is clear that  $b \notin B_{I',(\rho'_i)}$  whenever  $I' \neq I$  or  $(\rho'_i) \neq (\rho_i)$ .  $\square$

Let  $\mathcal{Q}_{I,(\rho_i)} := \{(A_{0,b}, (V_i)) \in \mathcal{Q} : b \in B_{I,(\rho_i)}\}$ . We will show that  $\mathcal{Q}_{I,(\rho_i)} \cong B_{I,(\rho_i)} \times (\text{some Springer fiber})$ . Then we will use the result about the irreducible components of a Springer fiber to find the irreducible components of  $\mathcal{Q}_{I,(\rho_i)}$ , and the closures of these will be the irreducible components of  $\mathcal{Q}$ .

## 6.2 Study of $B_{I,(\rho_i)}$

Fix any  $I$  and  $(\rho_i)$  satisfying the conditions (1)–(4) of Lemma 6.1. As before, we write  $\{i_1 < \dots < i_r\} := I$ , and  $q_{i_0} := n$ , and  $p_{i_{r+1}} := 0$ .

First, we provide an alternative characterization of  $B_{I,(\rho_i)}$ .

**Lemma 6.2.**  *$B_{I,(\rho_i)}$  is the set of  $b \in \mathbb{C}^m$  satisfying the following conditions.*

- For all  $k \in \{1, \dots, r\}$ ,  $p_{i_k} = \rho_{i_k}$ .
- For all  $i \notin I$ ,
  - For all  $k \in \{0, \dots, r\}$  such that  $\lambda_i > q_{i_k} + p_{i_{k+1}}$ , we have  $q_{i_k} \leq q_i$ .
  - For all  $k \in \{1, \dots, r+1\}$  such that  $\lambda_i \leq q_{i_{k-1}} + p_{i_k}$ , we have  $p_i \leq p_{i_k}$ .

*Proof.* First we show that every element of  $B_{I,(\rho_i)}$  satisfies those conditions. Let  $b \in B_{I,(\rho_i)}$ . It is clear that  $\forall k. p_{i_k} = \rho_{i_k}$ .

Take  $i \notin I$  and  $k \in \{0, \dots, r\}$  such that  $\lambda_i > q_{i_k} + p_{i_{k+1}}$ . Suppose for contradiction that  $q_i < q_{i_k}$ . Then  $p_i \leq \max_{j: q_j < q_{i_k}} p_j = p_{i_{k+1}}$ . Then  $\lambda_i = p_i + q_i < q_{i_k} + p_{i_{k+1}}$ , a contradiction. So we must have  $q_{i_k} \leq q_i$ , as desired.

Now take  $i \notin I$  and  $k \in \{1, \dots, r+1\}$  such that  $\lambda_i \leq q_{i_{k-1}} + p_{i_k}$ . Suppose for contradiction that  $p_i > p_{i_k}$ . Then, putting this together with the first inequality,  $\lambda_i - p_i < q_{i_{k-1}} + p_{i_k} - p_{i_k}$ ; that is,  $q_i < q_{i_{k-1}}$ . Consequently,  $p_i \leq \max_{j: q_j < q_{i_{k-1}}} p_j = p_{i_k}$ , as desired.

Now we have shown that every element of  $B_{I,(\rho_i)}$  satisfies the conditions of the lemma, and we proceed to the converse. Let  $b \in \mathbb{C}^m$  satisfy the conditions. Let  $k \in \{0, \dots, r\}$ . We need to show that  $\max_{j: q_j < q_{i_k}} p_j = p_{i_{k+1}}$ . Given the conditions (1)–(4) on  $\rho_i$ , it suffices to show that for each  $i \notin I$  with  $q_i < q_{i_k}$ , we have  $p_i \leq p_{i_{k+1}}$ . Indeed, given  $i \notin I$  with  $q_i < q_{i_k}$ , we cannot have  $\lambda_i > q_{i_k} + p_{i_{k+1}}$ , as that would imply (by hypothesis) that  $q_{i_k} \leq q_i$ . Hence  $\lambda_i \leq q_{i_{k-1}} + p_{i_k}$ , and consequently (by hypothesis)  $p_i \leq p_{i_k}$ .  $\square$

**Corollary 6.3.**  *$B_{I,(\rho_i)}$  is the set of  $b \in \mathbb{C}^m$  satisfying the following conditions.*

- For all  $k \in \{1, \dots, r\}$ ,  $p_{i_k} = \rho_{i_k}$ .

- For  $i \notin I$ ,
  - If  $\lambda_i \geq q_{i_0} + p_{i_1}$ , then  $p_i \leq \lambda_i - q_{i_0}$ .
  - If there is  $k \in \{1, \dots, r\}$  with  $q_{i_{k-1}} + p_{i_k} > \lambda_i \geq q_{i_k} + p_{i_{k+1}}$ , then  $p_i \leq \min(p_{i_k}, \lambda_i - q_{i_k})$ .
  - If  $q_{i_r} + p_{i_{r+1}} > \lambda_i$ , then  $p_i \leq p_{i_{r+1}}$ .

*Proof.* Both  $q_{i_k}$  and  $p_{i_k}$  are decreasing as  $k$  increases, so this follows directly from Lemma 6.2. (Note that  $p_i \leq \lambda_i - q_{i_k}$  iff  $q_{i_k} \leq q_i$ .)  $\square$

**Corollary 6.4.**

$$B_{I,(\rho_i)} \cong \prod_{k=1}^r (\mathbb{C}^{p_{i_k}-1} \times (\mathbb{C} \setminus \{0\})) \times \prod_{i: \lambda_i \geq q_{i_0} + p_{i_1}} \mathbb{C}^{\lambda_i - q_{i_0}} \times \prod_{k=1}^r \prod_{\{i \notin I: q_{i_{k-1}} + p_{i_k} > \lambda_i \geq q_{i_k} + p_{i_{k+1}}\}} \mathbb{C}^{\min(p_{i_k}, \lambda_i - q_{i_k})}.$$

*Proof.* Here we use the notation  $x \times y = (x, y)$ , and so on. The isomorphism sends  $b \in B_{I,(\rho_i)}$  to

$$\prod_{k=1}^r (b_{i_k 1}, \dots, b_{i_k \rho_{i_k}}) \times \prod_{i: \lambda_i \geq q_{i_0} + p_{i_1}} (b_{i 1}, \dots, b_{i, \lambda_i - q_{i_0}}) \times \prod_{k=1}^r \prod_{\{i \notin I: q_{i_{k-1}} + p_{i_k} > \lambda_i \geq q_{i_k} + p_{i_{k+1}}\}} (b_{i 1}, \dots, b_{i, \min(p_{i_k}, \lambda_i - q_{i_k})}).$$

Corollary 6.3 says that this is an isomorphism.  $\square$

**Corollary 6.5.**

$$\dim B_{I,(\rho_i)} = \sum_{i: \lambda_i \geq q_{i_0} + p_{i_1}} (\lambda_i - q_{i_0}) + \sum_{k=1}^r \sum_{\{i: q_{i_{k-1}} + p_{i_k} > \lambda_i \geq q_{i_k} + p_{i_{k+1}}\}} \min(p_{i_k}, \lambda_i - q_{i_k}).$$

*Proof.* Immediate from Corollary 6.4.  $\square$

### 6.3 Study of $\mathcal{Q}_{I,(\rho_i)}$

Fix any  $I$  and  $(\rho_i)$  satisfying the conditions (1)–(4) of Lemma 6.1. In this subsection we find the irreducible components of  $\mathcal{Q}_{I,(\rho_i)}$ .

We claim that there is some  $\mu(I, (\rho_i))$  such that every  $(A_{0,b}, U) \in \mathcal{Q}_{I,(\rho_i)}$  is similar to  $J(\mu)$ . By finding a algebraic map taking  $b \in B_{I,(\rho_i)}$  to a Jordan basis for  $A_{0,b}$ , we will put  $\mathcal{Q}_{I,(\rho_i)}$  in isomorphism with the product  $B_{I,(\rho_i)} \times (\text{Springer fiber at } J(\mu))$ . Then we will use our result about the usual Springer fiber at  $J(\mu)$  to find the irreducible components of  $\mathcal{Q}_{I,(\rho_i)}$ .

So, now we find a Jordan basis for  $A_{0,b}$ . As before, we write  $\{i_1, \dots, i_r\} := I$ , and  $q_{i_0} := n$ , and  $p_{i_{r+1}} := 0$ . We also write, somewhat abusively,  $b \in \mathbb{C}^{m+n}$  to refer to the vector  $(b, 0) \in \mathbb{C}^{m+n}$ .

**Lemma 6.6.** *The following vectors give a Jordan basis for  $A_{0,b}$ . (For convenience, we write  $A := A_{0,b}$  in this lemma and proof.)*

- For  $i \notin I$ , the chain of length  $p_i + q_i$  beginning with  $e_{i,p_i+q_i}$
- The chain of length  $n + p_{i_1}$  beginning with  $f_n - (A^{n+p_{i_1}} f_n \gg n + p_{i_1})$
- For  $k \in \{1, \dots, r\}$ , the chain of length  $q_{i_k} + p_{i_{k+1}}$  beginning with  $v_{i_k} - (A^{q_{i_k}+p_{i_{k+1}}} v_{i_k} \gg q_{i_k} + p_{i_{k+1}})$ , where  $v_{i_k} := A^{n-q_{i_k}} f_n - \sum_{l=1}^{p_{i_k}} b_{i_k l} e_{i,l+q_{i_k}}$

*Proof.* There are three things to check: (1) the chains are no longer than their claimed lengths, (2) the claimed lengths sum to  $m + n$ , and (3) the span of the chains is  $\mathbb{C}^{m+n}$ .

*Proof of (1).* It is obvious that a chain beginning with  $e_{i,p_i+q_i}$  has length  $p_i + q_i$ .

Now consider the chain beginning with  $f_n - (A^{n+p_{i_1}} f_n \gg n + p_{i_1})$ . Note that  $A^n f_n = b$ , so  $A^{n+p_{i_1}} f_n = A^{p_{i_1}} b = b \ll p_{i_1}$ . By shifting  $b$  left  $p_{i_1}$  times, we zero out all the rows  $i$  where  $q_i < n$ . This ensures that the operation of shifting  $b \ll p_{i_1}$  right  $n + p_{i_1}$  times is invertible by shifting left  $n + p_{i_1}$  times. That is,

$$\begin{aligned} A^{n+p_{i_1}} f_n &= \\ b \ll p_{i_1} &= \\ ((b \ll p_{i_1}) \gg n + p_{i_1}) \ll n + p_{i_1} &= \\ A^{n+p_{i_1}} (A^{n+p_{i_1}} f_n \gg n + p_{i_1}). \end{aligned}$$

This shows that the chain has length at most  $n + p_{i_1}$ , as desired.

Now, let  $k \in \{1, \dots, r\}$ . We have  $v_{i_k} = A^{n-q_{i_k}} f_n - \sum_{l=1}^{p_{i_k}} b_{i_k l} e_{i_k, l+q_{i_k}}$ . First we note that  $q_{i_k} < n$  by the definition of  $\mathcal{Q}_{I,(\rho_i)}$ , so the definition of  $v_{i_k}$  makes sense. We consider the chain beginning with  $v_{i_k} - (A^{q_{i_k}+p_{i_{k+1}}} v_{i_k} \gg q_{i_k} + p_{i_{k+1}})$ . Note that  $A^{q_{i_k}} v_{i_k}$  is just  $b$  with row  $i_k$  zeroed out. For brevity, we write  $b_{i_k} := A^{q_{i_k}} v_{i_k}$ . Note that  $b_{i_k} \ll p_{i_{k+1}}$  has rows  $l$  zeroed out, for all  $l$  with  $q_l < q_{i_k}$ . This ensures that shifting  $b_{i_k} \ll p_{i_{k+1}}$  right  $q_{i_k} + p_{i_{k+1}}$  times can be inverted by shifting left  $q_{i_k} + p_{i_{k+1}}$  times. That is,

$$\begin{aligned} A^{q_{i_k}+p_{i_{k+1}}} v_{i_k} &= \\ b_{i_k} \ll p_{i_{k+1}} &= \\ ((b_{i_k} \ll p_{i_{k+1}}) \gg q_{i_k} + p_{i_{k+1}}) \ll q_{i_k} + p_{i_{k+1}} &= \\ A^{q_{i_k}+p_{i_{k+1}}} (A^{q_{i_k}} v_{i_k} \gg q_{i_k} + p_{i_{k+1}}). \end{aligned}$$

This shows that the chain has length at most  $q_{i_k} + p_{i_{k+1}}$ , as desired.  $\square$

*Proof of (2).* The sum of the lengths is

$$\sum_{i \notin I} (p_i + q_i) + \sum_{k=0}^r (q_{i_k} + p_{i_{k+1}}) = \sum_i (q_i + p_i) = m + n.$$

$\square$

*Proof of (3).* Let  $W$  be the span of the chains listed. We need to show that  $W = \mathbb{C}^{m+n}$ . Because every  $i \in I$  satisfies  $q_i < n$ , clearly  $\langle e_{ij} \rangle_{i,j:q_i \geq n} \subseteq W$ .

We claim that  $f_n \in W$  as well. To see this, consider the chain beginning with  $f_n - (A^{n+p_{i_1}} f_n \gg n + p_{i_1})$ . As explained in the proof of (1), we have  $A^{n+p_{i_1}} f_n \in \langle e_{ij} \rangle_{i,j:q_i \geq n}$ . Consequently,  $(A^{n+p_{i_1}} f_n \gg n + p_{i_1}) \in \langle e_{ij} \rangle_{i,j:q_i \geq n} \subseteq W$ . Because  $f_n - (A^{n+p_{i_1}} f_n \gg n + p_{i_1}) \in W$ , this implies that  $f_n \in W$ .

Because  $AW \subseteq W$  (obvious, since  $W$  is a span of chains), the fact that  $f_n \in W$  implies that  $f_i \in W$  for each  $i$ , and also  $b \ll l \in W$  for each  $l \geq 0$ .

Now we are left with showing that  $\langle e_{ij} \rangle_{i,j:q_i < n} \subseteq W$ . It suffices to show that  $e_{i,\lambda_i} \in W$  for each  $i$  with  $q_i < n$ . This is obvious for  $i \notin I$ . So, we just need to show that  $e_{i_k, \lambda_{i_k}} \in W$  for each  $k \in \{1, \dots, r\}$ . We do this inductively; fix  $k$ , and suppose we have already shown that  $e_{i_{k'}, \lambda_{i_{k'}}} \in W$  for  $k' < k$ . We will show that  $e_{i_k, \lambda_{i_k}} \in W$ .

To see this, consider the chain beginning with  $v_{i_k} - (A^{q_{i_k}+p_{i_{k+1}}} v_{i_k} \gg q_{i_k} + p_{i_{k+1}})$ . (Recall  $v_{i_k} = A^{n-q_{i_k}} f_n - \sum_{l=1}^{p_{i_k}} b_{i_k l} e_{i_k, l+q_{i_k}}$ .) Since  $b_{i_k, p_{i_k}} \neq 0$

(by definition of  $p_{i_k}$ ), it suffices to show that  $\sum_{l=1}^{p_{i_k}} b_{i_k l} e_{i_k, l+q_{i_k}} \in W$ . As explained in the proof of (1), we have  $A^{q_{i_k}+p_{i_k+1}} v_{i_k} \in \langle e_{lj} \rangle_{q_l \geq q_{i_k}}$ . And since  $A^{q_{i_k}+p_{i_k+1}} v_{i_k}$  has row  $i_k$  zeroed out, in fact  $A^{q_{i_k}+p_{i_k+1}} v_{i_k} \in \langle e_{lj} \rangle_{l: l \neq i_k \wedge q_l \geq q_{i_k}}$ . Hence,  $A^{q_i+P_i} v_i \gg q_i + P_i \in \langle e_{lj} \rangle_{l: l \neq i \wedge q_l \geq q_i}$ . By our inductive hypothesis,  $\langle e_{lj} \rangle_{l: l \neq i_k \wedge q_l \geq q_{i_k}} \subseteq W$ , and consequently  $A^{q_{i_k}+p_{i_k+1}} v_{i_k} \gg q_{i_k} + p_{i_k+1} \in W$ . Since we know  $v_{i_k} - (A^{q_{i_k}+p_{i_k+1}} v_{i_k} \gg q_{i_k} + p_{i_k+1}) \in W$ , this implies that  $v_{i_k} \in W$ . Because  $A^{n-q_{i_k}} f_n \in W$ , this then implies that  $\sum_{l=1}^{p_{i_k}} b_{i_k l} e_{i_k, l+q_{i_k}} \in W$ , as desired.  $\square$

We proved (1), (2), (3), so we are done.  $\square$

Let  $\mu(I, (\rho_i))$  be the shape of the Jordan basis given in the lemma. Let  $X_\mu$  be the Springer fiber at  $J(\mu)$ , and let  $(X_{\mu, \alpha})_{\alpha \in \text{SYT}(\mu)}$  be the irreducible components.

Given a zero-indexed list  $L = [L_0, \dots, L_{l-1}]$ , we define  $\gamma(L) = \sum_i i L_i$ . We are interested in this thing because for any  $\alpha$ , the dimension of  $X_{\mu, \alpha}$  is  $\gamma([\mu_1, \dots, \mu_{k+1}])$ .

**Lemma 6.7.**

$$\gamma([\mu_1, \dots, \mu_{k+1}]) = \gamma([0, \lambda_1, \dots, \lambda_k]) - \left[ \sum_{i: \lambda_i \geq q_{i_0} + \rho_{i_1}} (\lambda_i - q_{i_0}) + \sum_{k=1}^r \sum_{\{i: q_{i_{k-1}} + p_{i_k} > \lambda_i \geq q_{i_k} + p_{i_{k+1}}\}} \min(p_{i_k}, \lambda_i - q_{i_k}) \right].$$

*Proof.* Let  $L = [q_{i_0}, \lambda_1, \dots, \lambda_k]$ . Note that

$$\mu = [\dots, q_{i_0} + p_{i_1}, \dots, q_{i_1} + p_{i_2}, \dots, \dots, q_{i_r} + p_{i_{r+1}}, \dots].$$

Let  $L'$  be the result of taking  $\mu$  and, for each  $x$ , replacing one occurrence of  $q_{i_x} + p_{i_{x+1}}$  by  $q_{i_x} + p_{i_x}$ ; that is,

$$L' = [\dots, q_{i_0}, \dots, q_{i_1} + p_{i_1}, \dots, q_{i_2} + p_{i_2}, \dots, q_{i_r} + p_{i_r}].$$

We can transform  $\mu$  into  $L'$  by just ‘moving’ each  $p_{i_k}$  to the right by  $1 + \#\{i \notin I : q_{i_{k-1}} + p_{i_k} > \lambda_i \geq q_{i_k} + p_{i_{k+1}}\}$  slots. So,

$$\gamma(L') - \gamma(\mu) = \sum_{k=1}^r p_{i_k} (1 + \#\{i \notin I : q_{i_{k-1}} + p_{i_k} > \lambda_i \geq q_{i_k} + p_{i_{k+1}}\}) =$$

$$\sum_{k=1}^r p_{i_k} \cdot \#\{i : q_{i_{k-1}} + p_{i_k} > \lambda_i \geq q_{i_k} + p_{i_{k+1}}\}.$$

Now we consider how to transform  $L'$  into  $L$ . First we shift  $q_{i_0}$  to the left by  $\#\{i \notin I : \lambda_i \geq q_{i_0} + p_{i_1}\}$  slots. Then we leave  $q_{i_0}$  in place and sort the rest of the list. This entails shifting each  $q_{i_x} + p_{i_x}$  to the left by  $\#\{i \notin I : q_{i_x} + p_{i_x} > \lambda_i \geq q_{i_x} + p_{i_{x+1}}\}$  slots. Shifting  $q_{i_x} + p_{i_x}$  to the left one slot, by swapping it with  $\lambda_i$ , changes the value of  $\gamma$  by  $\lambda_i - (q_{i_x} + p_{i_x})$ . To go from  $L'$  to  $L$ , we can just make these swaps repeatedly. So,

$$\gamma(L) - \gamma(L') =$$

$$\sum_{i \notin I : \lambda_i \geq q_{i_0} + p_{i_1}} (\lambda_i - q_{i_0}) + \sum_{k=1}^s \sum_{\{i \notin I : q_{i_k} + p_{i_k} > \lambda_i \geq q_{i_k} + p_{i_{k+1}}\}} (\lambda_i - (q_{i_k} + p_{i_k})).$$

Now, we put these two results together to get  $\gamma(L) - \gamma(\mu)$ .

$$\begin{aligned} & \gamma(L) - \gamma(\mu) = \\ & [\gamma(L) - \gamma(L')] + [\gamma(L') - \gamma(\mu)] = \\ & \left[ \sum_{i : \lambda_i \geq q_{i_0} + p_{i_1}} (\lambda_i - q_{i_0}) + \sum_{k=1}^s \sum_{\{i : q_{i_k} + p_{i_k} > \lambda_i \geq q_{i_k} + p_{i_{k+1}}\}} (\lambda_i - (q_{i_k} + p_{i_k})) \right] + \\ & \left[ \sum_{k=1}^s \sum_{\{i : q_{i_{k-1}} + p_{i_k} > \lambda_i \geq q_{i_k} + p_{i_{k+1}}\}} p_{i_k} \right] = \\ & \sum_{i : \lambda_i \geq q_{i_0} + p_{i_1}} (\lambda_i - q_{i_0}) + \sum_{k=1}^s \sum_{\{i : q_{i_{k-1}} + p_{i_k} > \lambda_i \geq q_{i_k} + p_{i_k}\}} p_{i_k} + \\ & \sum_{k=1}^s \sum_{i : q_{i_k} + p_{i_k} > \lambda_i \geq q_{i_k} + p_{i_{k+1}}} (\lambda_i - q_{i_k}) = \\ & \sum_{i : \lambda_i \geq q_{i_0} + p_{i_1}} (\lambda_i - q_{i_0}) + \sum_{k=1}^s \sum_{\{i : q_{i_{k-1}} + p_{i_k} > \lambda_i \geq q_{i_k} + p_{i_{k+1}}\}} \min(p_{i_k}, \lambda_i - q_{i_k}). \end{aligned}$$

Since  $\gamma(L) = \gamma([0, \lambda_1, \dots, \lambda_k])$ , the equation above implies the desired result.  $\square$

**Lemma 6.8.**  $\mathcal{Q}_{I,(\rho_i)} \cong B_{I,(\rho_i)} \times X_\mu$ .

*Proof.* For  $b \in B_{I,(\rho_i)}$ , let  $P_b$  be the change-of-basis matrix, with columns given by the Jordan basis of the previous lemma, so that  $J(\mu) = P_b^{-1}A_{0,b}P_b$ . From looking at the Jordan basis, it is clear that the map  $P : B_{I,(\rho_i)} \rightarrow \mathrm{GL}_{m+n}$ , given by  $b \mapsto P_b$ , is algebraic.

Now, we remark that the Springer fiber at  $A_{0,b}$  is simply  $\{P_b(V_i) : (V_i) \in X_\mu\}$ . This gives the isomorphism  $B_{I,(\rho_i)} \times X_\mu \rightarrow \mathcal{Q}_{I,(\rho_i)}$  defined by

$$(b, (V_i)) \mapsto (P_b J(\mu) P_b^{-1}, P_b(V_i)),$$

with inverse

$$(A_{0,b}, (V_i)) \mapsto (b, P_b^{-1}(V_i)).$$

□

**Corollary 6.9.** *For  $\alpha \in \mathrm{SYT}(\mu)$ , let  $\mathcal{Q}_{I,(\rho_i),\alpha}$  be the subvariety of  $\mathcal{Q}_{I,(\rho_i)}$  which corresponds to  $B_{I,(\rho_i)} \times X_{\mu,\alpha}$  via the isomorphism of Lemma 6.8. The subvarieties  $(\mathcal{Q}_{I,(\rho_i),\alpha})_{\alpha \in \mathrm{SYT}(\mu)}$  are the irreducible components of  $\mathcal{Q}_{I,(\rho_i)}$ . Each has dimension  $\gamma([0, \lambda_1, \dots, \lambda_k])$ .*

*Proof.* We know that  $B_{I,(\rho_i)}$  is irreducible by Corollary 6.4. Then, the fact that the  $B_{I,(\rho_i)} \times X_{\mu,\alpha}$  are the irreducible components of  $B_{I,(\rho_i)} \times X_\mu$  just follows from the fact that the  $X_{\mu,\alpha}$  are the irreducible components of  $X_\mu$ .

To get the dimension, we add the dimension of  $B_{I,(\rho_i)}$  to the dimension of  $X_{\mu,\alpha}$ . We get the dimension of  $B_{I,(\rho_i)}$  from Corollary 6.5, and we get the dimension of  $X_{\mu,\alpha}$  from Lemma 6.7. Adding them together, things cancel out and we get  $\gamma([0, \lambda_1, \dots, \lambda_k])$ . □

## 6.4 Conclusion

**Theorem 6.10.** *The irreducible components of  $\mathcal{Q}$  are the closures of the subvarieties  $\mathcal{Q}_{I,(\rho_i),\alpha}$ , as we let  $I, (\rho_i)$  range over all possibilities satisfying the conditions (1)–(4) of Lemma 6.1, and we let  $\alpha \in \mathrm{SYT}(\mu(I, (\rho_i)))$ .*

*Proof.* By Corollary 6.9, the  $\mathcal{Q}_{I,(\rho_i),\alpha}$  are irreducible and equidimensional. Then Lemma 6.1 says that their union is  $\mathcal{Q}$ , and in addition that none is contained in the union of the others. □

## 7 The components of $\mathcal{P}_{J(\lambda)}$

As in section 5, we write  $X = J(\lambda) \in \mathfrak{gl}_m$ , where  $\lambda = (\lambda_1, \dots, \lambda_k)$ . We write  $\mathcal{P} := \mathcal{P}_{J(\lambda)}$ , and  $A_{a,b} := A_{J(\lambda),a,b}$ . And as before,  $(e_{ij})_{ij}$  and  $(f_j)_j$  form the standard basis for  $\mathbb{C}^{m+n}$ .

### 7.1 The components of $\mathcal{Q}_{wr}$

Recall from section 5 the varieties

$$\mathcal{Q}_{wr} = \{(A_{e_{wr},b}, (V_i)) \in \mathcal{P}\}.$$

Fix any  $w, r$ . Lemma 5.5 tells us that

$$\mathcal{Q}_{wr} \cong \mathcal{Q}' := \{(A'_{X',0,b}, (V_i)) : \forall i. A'_{X',0,b} V_{i+1} \subseteq V_i\},$$

where  $X' = J(\lambda')$ , and  $\lambda' = (\lambda_1, \dots, \lambda_w - r, \dots, \lambda_k)$ , and  $m' = m - r$ , and  $n' = n + r$ .

Let  $(\mathcal{Q}'_{I,(\rho_i),\alpha})_{I,(\rho_i),\alpha}$  be the irreducible components of  $\mathcal{Q}'$  give by Theorem 6.10. Write  $\mathcal{Q}_{w,r,I,(\rho_i),\alpha}$  to denote the irreducible component of  $\mathcal{Q}_{wr}$  corresponding to  $\mathcal{Q}'_{I,(\rho_i),\alpha}$  via the isomorphism  $\mathcal{Q}_{wr} \cong \mathcal{Q}'$  of Lemma 5.5.

**Theorem 7.1.** *The irreducible components of  $\mathcal{Q}_{wr}$  are the subvarieties  $\mathcal{Q}_{w,r,I,(\rho_i),\alpha}$ . Each has dimension  $\sum_{i \leq j} \min(\lambda'_i, \lambda'_j)$ , where  $\lambda' = (\lambda_1, \dots, \lambda_{w-1}, \lambda_w - r, \lambda_{w+1}, \dots, \lambda_k)$ .*

*Proof.* From the foregoing discussion, it is clear that they are indeed the irreducible components. To calculate the dimension, we refer to Corollary 6.9, which says the dimension is  $\gamma([0, \lambda'_1, \dots, \lambda'_k])$ .  $\square$

### 7.2 The varieties $G_{wr}$ and $G$

Fix  $w, r$ . Recall from section 5 the groups  $G = \{P \in \mathrm{GL}_m : P^{-1}XP = X\}$  and  $G_{wr} = \{A \in G : e_{wr}A = e_{wr}\}$ .

**Lemma 7.2.**  *$G$  is irreducible and has dimension  $\sum_{i,j} \min(\lambda_i, \lambda_j)$ .*

*Proof.* The closure of  $G$  in  $\mathfrak{gl}_m$  is  $\mathfrak{z}_{\mathfrak{gl}_m}(X)$ . Lemma 9.3 says that  $\mathfrak{z}_{\mathfrak{gl}_m}(X)$  is isomorphic to  $\mathbb{C}^{\sum_{i,j} \min(\lambda_i, \lambda_j)}$ .  $\square$

**Lemma 7.3.**  *$G_{wr}$  is irreducible and has dimension  $\sum_{i,j} \min(\lambda_i, \lambda'_j)$ , where  $\lambda' = (\lambda_1, \dots, \lambda_{w-1}, \lambda_w - r, \lambda_{w+1}, \dots, \lambda_k)$ .*

*Proof.* The closure of  $G_{wr}$  in  $\mathfrak{gl}_m$  is  $V = \{Y \in \mathfrak{gl}_m(X) : e_{wr}Y = e_{wr}\}$ . In the case that  $r = 0$ , the constraint that  $e_{wr}Y = e_{wr}$  is no constraint at all, so we have  $G_{wr} = G$ , and the result follows from Lemma 7.2.

In the case that  $r > 0$ , we observe that  $V = \{Y + I : Y \in \mathfrak{gl}_m(X), e_{wr}Y = 0\}$ . The constraint  $e_{wr}Y = 0$  is just saying that a certain row of  $Y$  must be all zeroes. So, the set of  $Y$  such that  $Y + I \in V$  is the set described by Corollary 9.4. Hence  $V \cong \mathbb{C}^{\sum_{ij} \min(\lambda'_i, \lambda'_j)}$ .  $\square$

### 7.3 The components of $\mathcal{P}_{wr}$

Recall from section 5 the subvarieties  $\mathcal{P}_{wr} \subseteq \mathcal{P}$ . From Lemma 5.4 we have the principal  $G_{wr}$ -bundle  $\varphi_{wr} : \mathcal{Q}_{wr} \times G \rightarrow \mathcal{P}_{wr}$ .

**Theorem 7.4.** *Every irreducible component of  $\mathcal{P}_{wr}$  is the closure of some subvariety of the form  $\varphi_{wr}(\mathcal{Q}_{w,r,I,(\rho_i),\alpha} \times G)$ , and the closure of each subvariety of this form is an irreducible component. Each has dimension  $\sum_{i \leq j} \min(\lambda_i, \lambda_j)$ .*

**Remark 7.5.** *Theorem 7.4 does not say “the irreducible components of  $\mathcal{P}_{wr}$  are the closures of the subvarieties  $\varphi_{wr}(\mathcal{Q}_{w,r,I,(\rho_i),\alpha} \times G)$ ”, as that would seem to suggest some claim about distinctness. Further analysis is required to determine which ones are distinct.*

*Proof.* Together, Theorem 6.10 and Lemma 7.2 tell us that the  $\mathcal{Q}_{w,r,I,(\rho_i),\alpha}$  are irreducible, and their union is  $\mathcal{Q}_{wr}$ . Hence their images are irreducible, and the surjectivity of  $\varphi_{wr}$  implies that their union of their images is  $\mathcal{P}_{wr}$ .

Now, to verify that each image is an irreducible component, we need only verify that they are equidimensional. We use the result of Lemma 5.4, namely that  $\varphi_{wr}$  is a principal  $G_{wr}$ -bundle.

Let  $V_{w,r,I,(\rho_i),\alpha}$  be the closure of  $\mathcal{Q}_{w,r,I,(\rho_i),\alpha} \times G$  in  $\mathcal{Q}_{wr} \times G$  under action by  $G_{wr}$ . Clearly  $\varphi_{wr}(\mathcal{Q}_{w,r,I,(\rho_i),\alpha} \times G) = \varphi_{wr}(V_{w,r,I,(\rho_i),\alpha})$ . So, we have only to compute the dimension of  $\varphi(V_{w,r,I,(\rho_i),\alpha})$ .

This is easy, because  $\varphi_{wr}$  (and, consequently, the restriction of  $\varphi_{wr}$  to  $V_{w,r,I,(\rho_i),\alpha}$ ) is a principal  $G_{wr}$ -bundle, and principal bundles play nicely with dimensions. That is, we can conclude that

$$\dim \varphi_{wr}(V_{w,r,I,(\rho_i),\alpha}) = \dim V_{w,r,I,(\rho_i),\alpha} - \dim G_{wr}.$$

Since  $\dim(\mathcal{Q}_{w,r,I,(\rho_i),\alpha} \times G) = \dim(\mathcal{Q}_{wr} \times G)$  by Theorem 7.1, we know that  $\dim V_{w,r,I,(\rho_i),\alpha} = \dim(\mathcal{Q}_{w,r,I,(\rho_i),\alpha} \times G) = \dim \mathcal{Q}_{w,r,I,(\rho_i),\alpha} + \dim G$ . By the

equation above then, we get

$$\dim \varphi_{wr}(V_{w,r,I,(\rho_i),\alpha}) = \dim \mathcal{Q}_{w,r,I,(\rho_i),\alpha} + \dim G - \dim G_{wr}.$$

We already calculated those dimensions in Theorem 7.1, Lemma 7.2, and Lemma 7.3 respectively. Referring to those, we get

$$\dim \varphi_{wr}(V_{w,r,I,(\rho_i),\alpha}) = \sum_{i \leq j} \min(\lambda'_i, \lambda'_j) + \sum_{ij} \min(\lambda_i, \lambda_j) - \sum_{ij} \min(\lambda_i, \lambda'_j). \quad (1)$$

Now,

$$\sum_{i \leq j} \min(\lambda'_i, \lambda'_j) = \sum_{i \leq j} \min(\lambda_i, \lambda_j) - \sum_j \min(\lambda_w, \lambda_j) + \sum_j \min(\lambda_w - r, \lambda_j),$$

and

$$\sum_{ij} \min(\lambda_i, \lambda'_j) = \sum_{ij} \min(\lambda_i, \lambda_j) - \sum_i \min(\lambda_i, \lambda_w) + \sum_i \min(\lambda_i, \lambda_w - r).$$

Substituting these into the RHS of Equation (1), things cancel out, and we get

$$\sum_{i \leq j} \min(\lambda_i, \lambda_j) + \sum_{ij} \min(\lambda_i, \lambda_j) - \sum_{ij} \min(\lambda_i, \lambda_j) = \sum_{i \leq j} \min(\lambda_i, \lambda_j).$$

□

## 7.4 The components of $\mathcal{P}$

**Corollary 7.6.** *Every irreducible component of  $\mathcal{P}$  is the closure of some subvariety of the form  $\varphi_{wr}(\mathcal{Q}_{w,r,I,(\rho_i),\alpha} \times G)$ , and the closure of each subvariety of this form is an irreducible component. Each has dimension  $\sum_{i \leq j} \min(\lambda_i, \lambda_j)$ .*

*Proof.* Follows directly from Theorem 7.4. □

## 8 The components of $S \times_{\mathfrak{g}} \tilde{\mathcal{N}}$

Recall from Corollary 4.5 that

$$S \times_{\mathfrak{g}} \tilde{\mathcal{N}} \cong \{(A_{X,a,b}, (U_i), (V_i)) : \forall i. XU_{i+1} \subseteq U_i; \forall i. A_{X,a,b}V_{i+1} \subseteq V_i\}.$$

We defined  $\pi : S \times_{\mathfrak{g}} \tilde{\mathcal{N}} \rightarrow \mathcal{N}_m$  by  $(A_{X,a,b}, (U_i), (V_i)) \mapsto X$ , and called  $\pi^{-1}(X)$  the  $n$ -Slodowy-slice Springer fiber at  $X$ .

**Theorem 8.1.**  $\pi^{-1}(J(\lambda)) \cong \mathcal{P}_{J(\lambda)} \times X_\lambda$ . Each irreducible component of  $\pi^{-1}(J(\lambda))$  has dimension  $\sum_{ij} \min(\lambda_i, \lambda_j)$ .

*Proof.* The isomorphism sends  $(A_{X,a,b}, (U_i), (V_i))$  to  $((A_{X,a,b}, (U_i)), (V_i))$ . The irreducible components of  $\mathcal{P}_{J(\lambda)}$  are given by Corollary 7.6. Those of  $X_\lambda$  are given by Theorem 2.2. Adding the dimensions gives

$$\sum_{i \leq j} \min(\lambda_i, \lambda_j) + \sum_{i < j} \min(\lambda_i, \lambda_j) = \sum_{ij} \min(\lambda_i, \lambda_j).$$

□

Let  $\lambda$  be any partition of  $m$ . Let  $\mathrm{GL}_m \times \{I_n\}$  act on  $\pi^{-1}(J(\lambda))$  by conjugation; that is,

$$(P, I_n) \cdot (A_{X,a,b}, (U_i), (V_i)) := ((P, I_n)A_{X,a,b}(P, I_n)^{-1}, (P, I_n)(U_i), (P, I_n)(V_i)).$$

Let

$$K = \{(g, I_n) \in \mathrm{GL}_m \times \{I_n\} : gXg^{-1} = X\}.$$

Define  $\phi_\lambda : \pi^{-1}(J(\lambda)) \times (\mathrm{GL}_m \times \{I_n\}) \rightarrow S \times_{\mathfrak{g}} \tilde{\mathcal{N}}$  by  $\phi_\lambda(x, g) = g \cdot x$ .

**Lemma 8.2.** For each partition  $\lambda$  of  $m$ , the map  $\phi_\lambda$  is a principal  $K$ -bundle.

*Proof.* Analogous to Lemma 5.4. □

Let  $(C_{\lambda,\beta})_\beta$  be the irreducible components of  $\pi^{-1}(J(\lambda))$ . These are described by Theorem 8.1.

**Theorem 8.3.** Every irreducible component of  $S \times_{\mathfrak{g}} \tilde{\mathcal{N}}$  is the closure of some subvariety of the form  $\phi_\lambda(C_{\lambda,\beta} \times (\mathrm{GL}_m \times \{I_n\}))$ , and the closure of each subvariety of this form is an irreducible component. Each has dimension  $m^2$ .

*Proof.* This is analogous to Theorem 7.4; the only difference is the dimension calculation. This time, we have

$$\begin{aligned} \dim \phi_\lambda(C_{\lambda,\beta} \times (\mathrm{GL}_m \times \{I_n\})) &= \\ \dim C_{\lambda,\beta} + \dim \mathrm{GL}_m - \dim K &= \\ \sum_{ij} \min(\lambda_i, \lambda_j) + m^2 - \sum_{ij} \min(\lambda_i, \lambda_j) &= \\ m^2. \end{aligned}$$

The dimension of  $C_{\lambda,\beta}$  comes from Theorem 7.4; the dimension of  $\mathrm{GL}_m$  is obvious; and the dimension of  $K$  comes from Lemma 9.3. □

## 9 Linear Algebra Facts

In this section we prove linear algebra facts that were used earlier. They are confined to this section to avoid interrupting the rest of the paper.

### 9.1 The centralizer of a nilpotent matrix

**Definition 9.1.** A matrix  $Y$  is Toeplitz if it is constant along bands parallel to the main diagonal. That is,  $\forall i, j, k. Y_{ij} = Y_{i+k, j+k}$ .

**Definition 9.2.** An  $m \times n$  matrix  $Y$  is lower-left Toeplitz if it is Toeplitz and, in addition, we have  $y_{n-i, j-1} = 0$  whenever  $i + j \geq \min(m, n)$ .

That is,  $Y$  is lower-left Toeplitz if it is Toeplitz, and the only nonzero entries are those with Manhattan distance less than  $\min(m, n)$  from the entry in the bottom-left corner. In yet other words, all but the leftmost (equivalently, bottommost)  $\min(m, n)$  diagonal bands are zero.

**Lemma 9.3.** Let  $\lambda = (\lambda_1, \dots, \lambda_k)$  be a partition of  $m$ . The centralizer of  $J(\lambda)$  in  $\mathfrak{gl}_m$  is the subalgebra consisting of matrices

$$M = \begin{pmatrix} M_{11} & \cdots & M_{1k} \\ \vdots & & \vdots \\ M_{k1} & \cdots & M_{kk} \end{pmatrix},$$

where each  $M_{ij}$  is a  $\lambda_i \times \lambda_j$  matrix, such that each  $M_{ij}$  is lower-left Toeplitz.

*Proof.* Let

$$M = \begin{pmatrix} M_{11} & \cdots & M_{1k} \\ \vdots & & \vdots \\ M_{k1} & \cdots & M_{kk} \end{pmatrix}.$$

We need to show that  $J(\lambda)M = MJ(\lambda)$  if and only if each  $M_{ij}$  is lower-left Toeplitz.

We have

$$J(\lambda)M = \begin{pmatrix} J_{\lambda_1}M_{11} & \cdots & J_{\lambda_1}M_{1k} \\ \vdots & & \vdots \\ J_{\lambda_k}M_{k1} & \cdots & J_{\lambda_k}M_{kk} \end{pmatrix}, \text{ and } MJ(\lambda) = \begin{pmatrix} M_{11}J_{\lambda_1} & \cdots & M_{1k}J_{\lambda_k} \\ \vdots & & \vdots \\ M_{k1}J_{\lambda_1} & \cdots & M_{kk}J_{\lambda_k} \end{pmatrix}.$$

So, we have  $J(\lambda)M = MJ(\lambda)$  if and only if  $\forall i, j. J_{\lambda_i}M_{ij} = M_{ij}J_{\lambda_j}$ . Multiplying on the left by  $J_{\lambda_i}$  just shifts each row down by one, and multiplying on the right by  $J_{\lambda_j}$  shifts each column left by one. The matrices for which left-shifting gives the same result as down-shifting are exactly the lower-left Toeplitz matrices.  $\square$

**Corollary 9.4.** *Let  $\lambda = (\lambda_1, \dots, \lambda_k)$  be a partition of  $m$ . Let  $w \in \{1, \dots, k\}$  and  $r \in \{1, \dots, \lambda_w\}$ . Let  $i = [\sum_{j < w} \lambda_j] + r$ . The set of  $M \in \mathfrak{gl}_m(J(\lambda))$  such that the  $i$ th row of  $M$  is equal to zero is the set of matrices*

$$M = \begin{pmatrix} M_{11} & \cdots & M_{1k} \\ \vdots & & \vdots \\ M_{k1} & \cdots & M_{kk} \end{pmatrix},$$

where each  $M_{ij}$  is a  $\lambda_i \times \lambda_j$  matrix, such that:

- For  $i \neq w$ ,  $M_{ij}$  is lower-left Toeplitz
- Each  $M_{wj}$  is of the form

$$M_{wj} = \begin{pmatrix} 0 \\ M'_{wj} \end{pmatrix},$$

where  $M'_{wj}$  is a  $(\lambda_w - r) \times \lambda_j$  lower-left Toeplitz matrix.

## 9.2 A ‘normalization’ fact about Jordan bases

**Lemma 9.5.** *For any finite-dimensional  $V$ , nilpotent  $A : V \rightarrow V$ , and linear  $f : V \rightarrow \mathbb{C}$ , there is a Jordan basis  $e_{ij}$  for  $A$  such that there is at most one  $i$  such that there exists  $j$  such that  $f(e_{ij}) \neq 0$ .*

*Proof.* For any Jordan basis  $(e_{ij})_{ij}$  of  $A$ , define

$$S((e_{ij})_{1 \leq i \leq k, 1 \leq j \leq \lambda_i}) := \sum_i \begin{cases} -1, & \forall j. f(e_{ij}) = 0 \\ \lambda_i - \min\{j : f(e_{ij}) \neq 0\}, & \text{otherwise} \end{cases}.$$

We proceed by induction on the measure  $S$ . That is, let  $(e_{ij})_{ij}$  be a Jordan basis for  $A$ . Our inductive hypothesis is that if there exists a Jordan basis  $(e'_{ij})_{ij}$  with  $S((e'_{ij})_{ij}) < S((e_{ij})_{ij})$ , then we get the desired conclusion.

Now, we have two cases. In the first case,  $(e_{ij})_{ij}$  already satisfies the desired property. In this case we are done. In the other case, there exist  $i_1, j_1, i_2, j_2$  with  $i_1 \neq i_2$ , and  $f(e_{i_1 j_1}) \neq 0$ , and  $f(e_{i_2 j_2}) \neq 0$ . We let  $j_1, j_2$  be minimal with this property, so that  $\forall j < j_1$ .  $f(e_{i_1 j}) = 0$ , and  $\forall j < j_2$ .  $f(e_{i_2 j}) = 0$ . Wlog, we assume that  $\lambda_{i_1} - j_1 \leq \lambda_{i_2} - j_2$ .

By our inductive hypothesis, all we need to do is find a Jordan basis  $(e'_{ij})_{ij}$  with  $S((e'_{ij})_{ij}) < S((e_{ij})_{ij})$ . This is what we do. Define  $e'_{ij}$  as follows.

- $e'_{i_1, \lambda_1} := e_{i_1, \lambda_1} - \frac{f(e_{i_1, j_1})}{f(e_{i_2, j_2})} e_{i_2, j_2 + (\lambda_{i_1} - j_1)}$
- For  $j < \lambda_1$ ,  $e'_{i_1, j} := A^{\lambda_{i_1} - j} e'_{i_1, \lambda_1}$
- For  $i \neq i_1$ ,  $e'_{ij} := e_{ij}$ .

Clearly this is a Jordan basis for  $A$ . Further, we claim that  $S((e'_{ij})_{ij}) < S((e_{ij})_{ij})$ . It suffices to show that  $\forall j \leq j_1$ .  $f(e_{i_1, j}) = 0$ . We have

$$f(e'_{i_1, j}) = f\left(A^{\lambda_{i_1} - j} \left(e_{i_1, \lambda_1} - \frac{f(e_{i_1, j_1})}{f(e_{i_2, j_2})} e_{i_2, j_2 + (\lambda_{i_1} - j_1)}\right)\right) =$$

$$f\left(e_{i_1, j} - \frac{f(e_{i_1, j_1})}{f(e_{i_2, j_2})} e_{i_2, j_2 + (j - j_1)}\right) = f(e_{i_1, j}) - \frac{f(e_{i_1, j_1})}{f(e_{i_2, j_2})} f(e_{i_2, j_2 + (j - j_1)}).$$

Clearly (by design), this expression is zero when  $j = j_1$ . And for  $j < j_1$ , we have  $f(e_{i_1, j}) = f(e_{i_2, j_2 + (j - j_1)}) = 0$ , so it is zero then as well. Hence the measure  $S$  of this new basis is smaller, as desired.  $\square$

**Lemma 9.6.** *For any  $n$  and linear  $f : \mathbb{C}^n \rightarrow \mathbb{C}$ , there is a Jordan basis  $e_j$  for  $J_n$  such that there is at most one  $j$  with  $f(e_j) \neq 0$ .*

*Proof.* Let  $e_j$  be a Jordan basis for  $J_n$ . If  $\{j : f(e_j) \neq 0\}$  is the empty set, we are done. Otherwise, let  $j_0 = \min\{j : f(e_j) \neq 0\}$ . For any Jordan basis  $f_j$  with  $j_0 = \min\{j : f(e_j) \neq 0\}$ , define

$$S((f_j)_j) := \begin{cases} -1, & \{j > j_0 : f(e_j) \neq 0\} = \emptyset \\ n - \min\{j > j_0 : f(e_j) \neq 0\}, & \text{otherwise} \end{cases}.$$

We proceed by induction on  $S$ . That is, let  $(e_j)_j$  be a Jordan basis for  $J_n$  with  $j_0 = \min\{j : f(e_j) \neq 0\}$ . Our inductive hypothesis is that if there exists a Jordan basis  $(e'_j)_j$  with  $j_0 = \min\{j : f(e'_j) \neq 0\}$  and  $S((e'_j)_j) < S((e_j)_j)$ , then the conclusion holds.

We have two cases: either  $(e_j)_j$  satisfies the desired property, or not. If not, then let  $j_1 = \min\{j > j_0 : f(e_j) \neq 0\}$ , and define a new Jordan basis  $e'_j$  as follows.

- $e'_n := e_n - \frac{f(e_{j_1})}{f(e_{j_0})} e_{n-(j_1-j_0)}$
- For  $j < n$ ,  $e'_j := J_n^{n-j} e'_n$

It is straightforward to check that  $j_0 = \min\{j : f(e'_j) \neq 0\}$ , and that  $S((e'_j)_j) \leq S((e_j)_j) - 1$ . By our inductive hypothesis, we are done.  $\square$

**Theorem 9.7.** *For any finite-dimensional  $V$ , nilpotent  $A : V \rightarrow V$ , and linear  $f : V \rightarrow \mathbb{C}$ , there is a Jordan basis  $e_{ij}$  for  $A$  such that there is at most one pair  $(i, j)$  with  $f(e_{ij}) \neq 0$ .*

*Proof.* Lemma 9.5 provides a Jordan basis  $e_{ij}$  such that for all  $i \neq i_0$  and all  $j$ , we have  $f(e_{ij}) = 0$ . Restricting  $A$  to  $\langle e_{i_0 j} \rangle_j$  arbitrary gives a Jordan block, and then applying Lemma 9.6 gives the desired result.  $\square$

### 9.3 Nilpotency Lemmas

**Lemma 9.8.** *Let  $X \in \mathfrak{gl}_n$  be upper triangular. Then  $J_n + X$  is nilpotent if and only if  $X = 0$ .*

*Proof.* Clearly if  $X = 0$ , then  $J_n + X$  is nilpotent. Inversely, suppose  $X \neq 0$ . Let  $e_1, \dots, e_n$  be the standard basis, with  $J_n e_i = e_{i+1}$ . Let  $i_1 = \max\{i : X e_i \neq 0\}$ . As  $X$  is upper triangular, we have  $X e_{i_1} = v + a e_{i_2}$ , with  $a \in \mathbb{C} \setminus \{0\}$ ,  $i_2 \leq i_1$ , and  $v \in \langle e_1, \dots, e_{i_1-1} \rangle$ .

Now,  $(J_n + X)^{i_1} e_1 = e_{i_1+1} + v + a e_{i_2}$ . Then,  $(J_n + X)^{i_1+(n-i_1)} e_1 = 0 + (J_n + X)^{n-i_1} (v + a e_{i_2})$ . Clearly  $(J_n + X)^{n-i_1} (v + a e_{i_2}) = v' + a e_{i_2+n-i_1}$ , with  $v' \in \langle e_1, \dots, e_{i_2+n-i_1-1} \rangle$ . Now, since  $i_2 \leq i_1$ , we have  $i_2 + n - i_1 \leq n$ , and therefore  $(J_n + X)^n e_1 \neq 0$ . It follows that  $J_n + X$  is not nilpotent.  $\square$

**Lemma 9.9.** *Let  $X \in \mathfrak{gl}_m$ , and let*

$$Y = \begin{pmatrix} y_{11} & y_{12} & y_{13} & \cdots & y_{1,n-1} & y_{1n} \\ d_1 & y_{22} & y_{23} & \cdots & y_{2,n-1} & y_{2n} \\ & d_2 & y_{33} & \cdots & y_{3,n-1} & y_{3n} \\ & & \ddots & \cdots & \vdots & \vdots \\ & & & d_{n-2} & y_{n-1,n-1} & y_{n-1,n} \\ & & & & d_{n-1} & y_{nn} \end{pmatrix} \in \mathfrak{gl}_n.$$

For any  $a, b \in \mathbb{C}^m$ ,

$$\det \left( \begin{array}{c|c} X & \begin{array}{c} | \\ b \\ | \end{array} \\ \hline \begin{array}{c} - & a & - \end{array} & Y \end{array} \right) =$$

$$\det X \det Y + \left( \prod_i d_i \right) \det \left( \begin{array}{c|c} X & \begin{array}{c} | \\ b \\ | \end{array} \\ \hline \begin{array}{c} - & a & - \end{array} & 0 \end{array} \right)$$

*Proof.* By induction on  $n$ . In the case  $n = 1$ , expanding along the last row (taking the usual interpretation of the empty product) gives the desired result.

Now suppose  $n > 1$ . Expanding along the last row, we get

$$d_{n-1} \det \left( \begin{array}{c|c} X & \begin{array}{c} | \\ b \\ | \end{array} \\ \hline \begin{array}{c} - & a & - \end{array} & Y_{n,n-1} \end{array} \right) - y_{nn} \det \left( \begin{array}{c|c} X & \begin{array}{c} | \\ \\ | \end{array} \\ \hline \begin{array}{c} - & a & - \end{array} & Y_{n,n} \end{array} \right).$$

Using our inductive hypothesis for the first determiniant, and using that  $\det \left( \begin{array}{c|c} A_{11} & 0 \\ \hline A_{21} & A_{22} \end{array} \right) = \det A_{11} \det A_{22}$  for the second, the expression becomes

$$d_{n-1} \left( \det X \det Y_{n,n-1} + \left( \prod_{i \leq n-2} d_i \right) \det \left( \begin{array}{c|c} X & \begin{array}{c} | \\ b \\ | \end{array} \\ \hline \begin{array}{c} - & a & - \end{array} & 0 \end{array} \right) \right) - y_{nn} \det X \det Y_{nn} =$$

$$(d_{n-1} Y_{n,n-1} - y_{nn} \det Y_{nn}) \det X + \left( \prod_i d_i \right) \det \left( \begin{array}{c|c} X & \begin{array}{c} | \\ b \\ | \end{array} \\ \hline \begin{array}{c} - & a & - \end{array} & 0 \end{array} \right) =$$

$$\det Y \det X + \left( \prod_i d_i \right) \det \left( \begin{array}{ccc|c} & & & \\ & X & & b \\ & & & \\ \hline - & a & - & 0 \end{array} \right).$$

□

**Corollary 9.10.** *If  $X$  is nilpotent, and*

$$\left( \begin{array}{ccc|c} & & & \\ & X & & b \\ & & & \\ \hline - & a & - & \\ & & & Y \end{array} \right)$$

*is nilpotent as well, then  $Y$  is nilpotent.*

*Proof.* By the previous lemma, the characteristic polynomial of the big matrix is

$$g_X(\lambda)g_Y(\lambda) + f(\lambda),$$

where  $g_X(\lambda) = \lambda^m$  is the characteristic polynomial of  $X$ , and  $f(\lambda)$  is some polynomial of degree at most  $m - 1$ . □
