#### 1 Introduction

We will review the definition of a Springer fiber and define, for a nilpotent  $Y \in \mathfrak{gl}_m$ , the Springer fiber at the *n*-Slodowy slice at Y. For every n and every nilpotent  $Y \in \mathfrak{gl}_m$ , we will find the irreducible components of the Springer fiber at the *n*-Slodowy slice at Y. Finally, we will use our results about Springer fibers at *n*-Slodowy slices to find the irreducible components of some other variety (which probably needs a name), and show that they all have the same dimension.

## 2 Springer fibers

Let  $G \subseteq GL_m(\mathbb{C})$  be a connected semisimple Lie group, and let  $\mathfrak{g} \subseteq \mathfrak{gl}_m(\mathbb{C})$  be its Lie algebra. Let  $\mathcal{N} \subseteq \mathfrak{g}$  be the subset consisting of nilpotent elements. Let  $\mathcal{B}$  be the variety of Borel subalgebras of  $\mathfrak{g}$ . Let  $\widetilde{\mathcal{N}} = \{(\mathfrak{b}, n) : n \in \mathfrak{b}\} \subseteq \mathcal{B} \times \mathcal{N}$ . Let  $\pi : \widetilde{\mathcal{N}} \to \mathcal{N}$  be the projection onto the second coordinate. For  $n \in \mathcal{N}$ , we call  $\pi^{-1}(n)$  the *Springer fiber at n*.

We mention some results about Springer fibers, which we will use later in this paper. TODO: mention them.

## 3 Slodowy slice

A basis for  $\mathfrak{sl}_2(\mathbb{C})$  is

$$e':=\begin{pmatrix}0&1\\0&0\end{pmatrix},h':=\begin{pmatrix}1&0\\0&-1\end{pmatrix},f':=\begin{pmatrix}0&0\\1&0\end{pmatrix}.$$

Given a Lie algebra  $\mathfrak{g}$ , and a homomorphism  $\phi: \mathfrak{sl}_2 \to \mathfrak{g}$  sending (e', h', f') to (e, h, f), we say that (e, h, f) is an  $\mathfrak{sl}_2$ -triple. Observe that e, f must be nilpotent, and h must be Cartan (???). If  $\mathfrak{g}$  is semisimple, then given any nilpotent  $e \in \mathfrak{g}$ , the Jacobson-Morozov theorem [1, 3.7.1] says that there exist  $h, f \in \mathfrak{g}$  such that (e, h, f) is an  $\mathfrak{sl}_2$ -triple.

Given (e, h, f), we define the *Slodowy slice at* e as  $S_e := e + \ker \operatorname{ad}_f$ . By the Jacobson-Morozov theorem, we can always find a Slodowy slice at any nilpotent  $e \in \mathfrak{g}$ , when  $\mathfrak{g}$  is semisimple.

# 4 Finding $\mathfrak{sl}_2$ -triples (E, H, F) in $\mathfrak{gl}_{m+n}$ with a particular E.

Let

$$e = \begin{pmatrix} 0 & & & \\ 1 & 0 & & & \\ & 1 & \ddots & & \\ & & \ddots & 0 & \\ & & & 1 & 0 \end{pmatrix} \in \mathfrak{gl}_n,$$

and let  $E = \begin{pmatrix} 0 & 0 \\ 0 & e \end{pmatrix} \in \mathfrak{gl}_{m+n}$ . We will show that there is exactly one  $\mathfrak{sl}_2$ -triple (E, H, F), and we will find what it looks like. First we solve the case m = 0 (so E = e), and then we use this to solve the case of arbitrary m.

**Lemma 4.1.** There is exactly one way to choose  $h, f \in \mathfrak{gl}_n$  so that (e, h, f) is an  $\mathfrak{sl}_2$ -triple.

Proof. Note that [h', e'] = 2e', and [e', f'] = h', and [h', f'] = -2f'. Thus e, h, f must obey the same relations. In particular, he - eh = 2e. The matrix eh is h shifted down one, and he is h shifted left one. Thus,  $2e_{ij} = (he - eh)_{ij} = h_{i,j+1} - h_{i-1,j}$ . We can use this to show that  $h_{ij} = 0$  when  $i \neq j$ . Then we can use it to show that  $h_{ii} = h_{i-1,i-1} + 2$ , so that  $h_{ii} = h_{i1} + 2(i-1)$ .

Similarly, from [e, f] = h we get that  $h_{ij} = (ef - fe)_{ij} = f_{i-1,j} - f_{i,j+1}$ . We can use this to show that  $f_{ij} = 0$  when  $j \neq i+1$ . Then we can use it to show that  $f_{i,i+1} = f_{i+1,i+2} + h_{i+1,i+1}$ , that  $f_{1,2} = -h_{1,1}$ , and that  $f_{n-1,n} = h_{n,n}$ . From the first equation we find that

$$-h_{1,1} = f_{1,2} = f_{n-1,n} + \sum_{i=1}^{n-1} h_{ii} = \sum_{i=1}^{n} h_{ii} \implies$$
$$\sum_{i} h_{ii} = 0.$$

Remark: this is just the statement that  $h \in \mathfrak{sl}_n$ ; in other words, we will see that every choice of  $\mathfrak{sl}_2$ -triple in  $\mathfrak{gl}_{m+n}$  is also an  $\mathfrak{sl}_2$ -triple in  $\mathfrak{sl}_{m+n}$ . This shows that  $h_{11} = n - 1, h_{22} = n - 3, ..., h_{nn} = 1 - n$ . So we have determined

h; it is

$$h = \begin{pmatrix} n-1 & & & & \\ & n-3 & & & \\ & & \ddots & & \\ & & & 3-n & \\ & & & & 1-n \end{pmatrix}.$$

Now, we can use our expression for f in terms of h to obtain

$$f = \begin{pmatrix} 0 & 1-n & & & & & & & & \\ & 0 & (1-n)+(3-n) & & & & & & & \\ & & & \ddots & & & & & & \\ & & & 0 & (1-n)+\dots+(n-1) \end{pmatrix} = \begin{pmatrix} 0 & 1(1-n) & & & & & \\ & 0 & 2(2-n) & & & & \\ & & 0 & (n-2)(-2) & & & \\ & & 0 & (n-1)(-1) \end{pmatrix}.$$

**Lemma 4.2.** There is exactly one way to choose  $H, F \in \mathfrak{gl}_{m+n}$  so that (E, H, F) is an  $\mathfrak{sl}_2$ -triple.

*Proof.* Suppose we have H, F so that (E, H, F) is an  $\mathfrak{sl}_2$ -triple. Writing  $F =: \begin{pmatrix} F_{11} & F_{12} \\ F_{21} & f \end{pmatrix}$ , and similarly for H, we have

$$2E = [H, E] = \begin{pmatrix} 0 & H_{12}e \\ 0 & he \end{pmatrix} - \begin{pmatrix} 0 & 0 \\ eH_{21} & eh \end{pmatrix},$$

$$H = [E, F] = \begin{pmatrix} 0 & 0 \\ eF_{21} & ef \end{pmatrix} - \begin{pmatrix} 0 & F_{12}e \\ 0 & fe \end{pmatrix}.$$

From these we observe that (e, h, f) must also be an  $\mathfrak{sl}_2$ -triple, so h, f must be as in Lemma 4.1. We also see that  $H_{11} = 0$ . Recalling that left multiplication by e is a down-shift, and right multiplication is a left-shift, we see that  $H_{12}$ 

is all zeroes except for the leftmost column, and  $H_{21}$  is all zeroes except for the bottom row. Then our final constraint is that

$$-2F = [H, F] =$$

$$\begin{pmatrix} H_{12}F_{21} & H_{12}F_{22} \\ H_{21}F_{11} + H_{22}F_{21} & H_{21}F_{12} + H_{22}F_{22} \end{pmatrix} - \begin{pmatrix} F_{12}H_{21} & F_{11}H_{12} + F_{12}H_{22} \\ F_{22}H_{21} & F_{21}H_{12} + F_{22}H_{22} \end{pmatrix}.$$

Now  $H_{12} = F_{12}e$ , and  $H_{21} = eF_{21}$ , from the equation H = [E, F]. Substituting in the equation above then,

$$-2F = \begin{pmatrix} F_{12}eF_{21} & F_{12}ef \\ eF_{21}F_{11} + hF_{21} & eF_{21}F_{12} + hf \end{pmatrix} - \begin{pmatrix} F_{12}eF_{21} & F_{11}F_{12}e + F_{12}h \\ feF_{21} & F_{21}F_{12}e + fh \end{pmatrix} = \\ \begin{pmatrix} 0 & F_{12}(fe+h) \\ eF_{21}F_{11} + hF_{21} & eF_{21}F_{12} + hf \end{pmatrix} - \begin{pmatrix} 0 & F_{11}F_{12}e + F_{12}h \\ (ef-h)F_{21} & F_{21}F_{12}e + fh \end{pmatrix} = \\ \begin{pmatrix} 0 & F_{12}fe \\ eF_{21}F_{11} & eF_{21}F_{12} + hf \end{pmatrix} - \begin{pmatrix} 0 & F_{11}F_{12}e \\ efF_{21} & F_{21}F_{12}e + fh \end{pmatrix}.$$

Now we see that  $F_{11} = 0$ , and consequently that  $F_{12} = F_{21} = 0$  as well. This shows that  $H_{12} = H_{21} = 0$ . We conclude that H and F just have h and f in their bottom-right corners, respectively.

# 5 Finding the Slodowy slices with the same E

First we find ker  $\mathrm{ad}_f$ . We have  $(fX)_{ij} = i(n-i)A_{i+1,j}$ , and  $(Xf)_{ij} = (j-1)(n-(j-1))A_{i,j-1}$ . So, for all  $i,j\in\{1,...,n\}$ , we have

$$i(n-i)A_{i+1,j} = (j-1)(n-(j-1))A_{i,j-1}.$$

Taking j = 1, we find that  $A_{i,1} = 0$  for  $i \ge 2$ . Then, taking j > 1, we find that for  $i, j \in \{1, ..., n-1\}$ ,

$$A_{i+1,j+1} = \frac{(j-1)(n-(j-1))}{i(n-i)} A_{ij}.$$

So,  $\ker \operatorname{ad}_f$  is the set of matrices which are upper triangular and satisfy the above condition.

To find the Slodowy slice associated to the previous  $\mathfrak{sl}_2$ -triple (E, H, F), we just need to find ker  $\mathrm{ad}_F$ . We have

$$[F, X] = \begin{pmatrix} 0 & 0 \\ fX_{21} & fX_{22} \end{pmatrix} - \begin{pmatrix} 0 & X_{12}f \\ 0 & X_{22}f \end{pmatrix}.$$

Thus,  $X_{21}$  must be all zeroes except for the first row, and  $X_{12}$  must be all zeroes except for the last column, and  $X_{22} \in \ker \operatorname{ad}_f$ . There is no restriction on  $X_{11}$ . This describes  $\ker \operatorname{ad}_F$ .

For  $X \in \mathcal{S}_{m,n}$ , define  $u(X) := X_{11}$ .

# 5.1 Finding $\widetilde{\mathcal{N}}_{m,n}$

Let  $\mathcal{N}_m \subseteq \mathfrak{gl}_m$  be the nilpotent elements. Let  $\mathcal{S}'_{m,n}$  be the set of  $X \in \mathcal{S}_{m,n}$  such that both X and u(X) are nilpotent. Let  $\widetilde{\mathcal{N}}_{m,n} = \{(\mathfrak{b},X) : X \in \mathfrak{b}\} \subseteq \mathcal{B}_{m+n} \times \mathcal{S}'_{m,n}$ . Define  $\pi_{m,n} : \widetilde{\mathcal{N}}_{m,n} \to \mathcal{N}_m$  by  $(\mathfrak{b},X) \mapsto X_{11}$ . For  $Y \in \mathfrak{gl}_m$ , we call  $\pi_{m,n}^{-1}(Y)$  the Springer fiber at the n-Slodowy slice at Y.

**Lemma 5.1.** Let J be a jordan block with zeroes along the diagonal, and let A be upper triangular and nonzero. Then J + A is not nilpotent.

Proof. It is straightforward to show by induction that if  $v_i = 0$  for i < j, and  $v_j \neq 0$ , then  $((J+A)^k v_j)_{j+k} = v_j$ . Let i be such that  $Ae_i \neq 0$ . Then  $(J+A)^{i-1}e_1$  has nonzero  $e_i$ -component. Then  $(J+A)^ie_1$  has some nonzero  $e_i$ -component for some  $i' \leq i$ . Then  $(J+A)^{i+(n-i')}e_1$  has some nonzero  $e_n$ -component. And  $i + (n-i') \geq n$ , so we're done.

Lemma 5.2. Let  $X \in \mathfrak{gl}_m$ , and let

$$Y = \begin{pmatrix} y_{11} & y_{12} & y_{13} & \cdots & y_{1,n-1} & y_{1n} \\ d_1 & y_{22} & y_{23} & \cdots & y_{2,n-1} & y_{2n} \\ & d_2 & y_{33} & \cdots & y_{3,n-1} & y_{3n} \\ & & \ddots & \ddots & \vdots & \vdots \\ & & & d_{n-2} & y_{n-1,n-1} & y_{n-1,n} \\ & & & & d_{n-1} & y_{nn} \end{pmatrix} \in \mathfrak{gl}_n.$$

For any  $a, b \in \mathbb{C}^m$ ,

$$\det \begin{pmatrix} X & & | & b \\ X & & | & b \\ \hline - & a & - & | & Y \end{pmatrix} =$$

$$\det X \det Y + \left(\prod_i d_i\right) \det \begin{pmatrix} X & \begin{vmatrix} 1 \\ b \\ -a & - \end{vmatrix} 0$$

*Proof.* By induction on n. In the case n = 1, expanding along the last row (taking the usual interpretation of the empty product) gives the desired result.

Now suppose n > 1. Expanding along the last row, we get

Using our inductive hypothesis for the first determiniant, and using that  $\det \begin{pmatrix} A_{11} & 0 \\ A_{21} & A_{22} \end{pmatrix} = \det A_{11} \det A_{22}$  for the second, the expression becomes

$$d_{n-1}\left(\det X\det Y_{n,n-1}+\left(\prod_{i\leq n-2}d_i\right)\det\left(\begin{array}{c|c}X&\begin{vmatrix}|\\&X&\\&&|\\-&a&-\end{vmatrix}0\right)\right)-y_{nn}\det X\det Y_{nn}=$$

$$(d_{n-1}Y_{n,n-1} - y_{nn} \det Y_{nn}) \det X + \left(\prod_{i} d_{i}\right) \det \begin{pmatrix} X & \begin{vmatrix} 1 \\ b \end{vmatrix} \\ -a & - \end{vmatrix} =$$

$$\det Y \det X + \left(\prod_i d_i\right) \det \begin{pmatrix} & & & | & | \\ & X & & | & b \\ \hline & - & a & - & | & 0 \end{pmatrix}.$$

Corollary 5.3. If X is nilpotent, and

$$egin{pmatrix} X & & b \ & b \ & & ert \ & & & ert \ \end{pmatrix}$$

is nilpotent as well, then Y is nilpotent (TODO: and that other determinant is zero).

*Proof.* By the previous lemma, the characteristic polynomial of the big matrix is

$$g_X(\lambda)g_Y(\lambda) + f(\lambda),$$

where  $g_X(\lambda) = \lambda^m$  is the characteristic polynomial of X, and  $f(\lambda)$  is some polynomial of degree at most m-1.

Now, taking the previous corolloary and the first lemma together, we see that

$$\mathcal{S}'_{m,n} = \left\{ \left( \begin{array}{c|ccc} X & & & | \\ X & & & b \\ \hline - & a & - & 0 \\ & & 1 & 0 \\ & & & \ddots & \ddots \\ & & & 1 & 0 \\ \end{array} \right) : a,b \in \mathbb{C}^m, X \in \mathfrak{gl}_m \text{ is nilpotent} \right\}.$$

# 6 Simplifying the definition of a Springer fiber at a Slodowy slice

Let  $\mathcal{N}_m \subseteq \mathfrak{gl}_m(\mathbb{C})$  be the subset consisting of nilpotent elements. For  $X \in \mathcal{N}_m$  and  $a, b \in \mathbb{C}^m$ , let

By the definition given in the previous section, we have

$$\widetilde{\mathcal{N}}_{m,n} = \{(\mathfrak{b}, X) : X \in \mathfrak{b}\} \subseteq \mathcal{B}_{m+n} \times \mathcal{S}'_{m,n},$$

and the Springer fiber at the n-Slodowy slice at a nilpotent  $X \in \mathfrak{gl}_m$  is

$$\pi_{m,n}^{-1}(X) = \{ (\mathfrak{b}, A_{X,a,b}) : A_{X,a,b} \in \mathfrak{b}, A_{X,a,b} \in \mathcal{S}'_{m,n} \}$$

$$= \{ (\mathfrak{b}, A_{X,a,b}) : A_{X,a,b} \in \mathfrak{b}, A_{X,a,b} \text{ nilpotent} \}$$

$$\cong \{ (\mathfrak{b}, a, b) : A_{X,a,b} \in \mathfrak{b}, A_{X,a,b} \text{ nilpotent} \}.$$

We will make one last simplification to this by using a correspondence between Borel subalgebras and complete flags. TODO: fix the next few paragraphs, they are out of context.

We have  $\mathcal{M} = \{AHA^{-1} : A \in \operatorname{GL}_{m+n}(\mathbb{C})\}$ , where  $H \subseteq \mathfrak{gl}_{m+n}(\mathbb{C})$  is the set of upper triangular matrices. We say a map  $X : \mathfrak{gl}_{m+n} \to \mathfrak{gl}_{m+n}$  preserves a flag  $V_0 \subseteq \cdots \subseteq V_{m+n}$  if  $XV_i \subseteq V_i$  for each i. Let  $E_0 \subseteq \cdots \subseteq E_{m+n}$  be the standard flag of  $\mathbb{C}^{m+n}$ . Since H is the set of X which preserve E,

$$\mathcal{M} = \{ \{ X : \forall i. \ X(AE_i) \subseteq AE_i \} : A \in \operatorname{GL}_n(\mathbb{C}) \}.$$

So, for  $X \in \mathcal{N}$ ,

$$\pi^{-1}(X) \cong \{(V, a, b) : \forall i. \ A_{X,a,b} V_i \subseteq V_{i-1}\}.$$

# 7 Strategy and setup for finding the irreducible components of a Springer fiber at a Slodowy slice

Fix any  $X \in \mathcal{N}$ . As we have fixed X, we now write  $A_{a,b} := A_{X,a,b}$ . Let  $(e_{ij})_{1 \leq i \leq k, 1 \leq j \leq \lambda_i}$  be a Jordan basis for X. For convenience we define  $e_{i0} := 0$ ; now we may express the fact that  $(e_{ij})$  is a Jordan basis by writing  $\forall i.Xe_{ij} = e_{i,j-1}$ .

In this section we find the irreducible components of

$$\pi^{-1}(X) \cong V := \{ (A_{a,b}, U) : \forall i. \ A_{a,b}U_{i+1} \subseteq U_i \}.$$

For  $1 \le w \le k$  and  $0 \le r \le \lambda_w$  (note that we allow r = 0), define

$$V_{w,r} := \{ (A_{a,b}, U) \in V : \exists P \in GL_m . \exists b'. (P^{-1}, I_n) A_{a,b}(P, I_n) = A_{e_{wr},b'} \}.$$

**Lemma 7.1.**  $V = \bigcup_{1 \leq w \leq k, 0 \leq r \leq \lambda_w} V_{w,r}$ . Further,  $V_{w_1r_1} = V_{w_2r_2}$  exactly when either  $r_1 = r_2 = 0$ , or  $\lambda_{w_1} = \lambda_{w_2} \wedge r_1 = r_2$ . When  $V_{w_1r_1} \neq V_{w_2r_2}$ , we have  $V_{w_1r_1} \cap V_{w_2r_2} = \emptyset$ .

Now, fix any w and r. We will find the irreducible components of  $V_{w,r}$ . These will all happen to be equidimensional (with dimensions independent of w and r), so their closures in V will be the irreducible components of V.

Let

$$G := \{ P \in \operatorname{GL}_m : P^{-1}XP = X \},$$

and

$$G_{wr} = \{ A \in G : e_{wr}A = e_{wr} \}.$$

Now, define

$$U_{wr} = \{(A_{e_{wr},b}, U) \in V_{wr}\}.$$

Let G act on  $V_{wr}$  by

$$P \cdot (A_{e_{wr},b}, U) := ((P, I_n)A_{e_{wr},b}(P, I_n)^{-1}, (P, I_n)U) = (A_{e_{wr}P^{-1},Pb}, (P, I_n)U).$$

Consider the map  $\varphi: U_{wr} \times G \to V_{wr}$  defined by

$$(x, P) \mapsto P \cdot x.$$

By restriction of G to  $G_{wr}$  and  $V_{wr}$  to  $U_{wr}$ , we obtain an action of  $G_{wr}$  on  $U_{wr}$ . Then, letting  $G_{wr}$  act on G by  $g \cdot h := hg^{-1}$ , we obtain an action of  $G_{wr}$  on  $U_{wr} \times G$ .

Lemma 7.2. As an algebraic variety, G is irreducible.

*Proof.* It's just  $\mathbb{C}^{something}$ , since its blocks are the lower-left-toeplitz matrices.

**Lemma 7.3.** The map  $\varphi$  is some sort of quotient by the action of  $G_{wr}$ .

*Proof.* Let  $y \in V_{wr}$ . By definition of  $V_{wr}$ , there is  $P_y \in G$  with  $P_y \cdot y \in U_{wr}$ . We have

$$\varphi^{-1}(y) = \{(x, P) : P \cdot x = y = P_y^{-1} \cdot (P_y \cdot y)\} =$$

$$\{(x, P) : x = (P^{-1}P_y^{-1}) \cdot (P_y \cdot y)\} =$$

$$\{((P^{-1}P_y^{-1}) \cdot (P_y \cdot y), P) : (P^{-1}P_y^{-1}) \in G_{wr}\} =$$

$$(\text{taking } Q := P^{-1}P_y^{-1}, \text{ so } P = (QP_y)^{-1} = P_y^{-1}Q^{-1})$$

$$\{(Q \cdot (P_y \cdot y), P_y^{-1}Q^{-1}) : Q \in G_{wr}\} =$$

$$\{Q \cdot (P_y \cdot y, P_y^{-1}) : Q \in G_{wr}\}.$$

So we see that the fibers are exactly the  $G_{wr}$ -orbits.

Now, what kind of quotient is this? All I need is something that allows me to deduce the dimension of the quotient...  $\Box$ 

Our strategy is to find the irreducible components  $X \subseteq U_{wr}$ , and we will then argue that the irreducible components of  $V_{wr}$  are of the form  $\varphi(X \times G)$ . So, we will now find the irreducible components of  $U_{wr}$ .

Actually this will be unnecessarily difficult to think about; it is easiest in the case r=0. So, we will change basis to make r=0. Let  $\lambda'=(\lambda_1,...,\lambda_{w-1},\lambda_w-r,\lambda_{w+1},...,\lambda_k)$ . Let X' be in Jordan normal form with shape  $\lambda'$ . Let  $U'_{wr}=\{(A_{X',0,b},U): \forall i.A_{X',0,b}U_{i+1}\subseteq U_i\}$ . Let  $e'_{ij}$  be a Jordan basis for X'. Let  $f_1,...,f_n$  be a Jordan basis for the restriction of  $A_{X,0,b}$  to ... Set m':=m-r, and n':=n+r. Let  $f'_1,...,f'_{n'}$  blah. Define the linear map  $Q_{wr}:\mathbb{C}^{m'+n'}\to\mathbb{C}^{m+n}$  by:

- For all  $i, e'_{ij} \mapsto e_{ij}$ .
- For  $j = 1, ..., r, f'_{n+j} \mapsto e_{w,(\lambda_w r) + j}$ .

• For  $j = 1, ..., n, f'_{i} \mapsto f_{j} + e_{w,(\lambda_{w}-r)-n+j}$ 

Observe that conjugation by  $Q_{wr}$  maps  $U_{wr}$  to  $U'_{wr}$ , and conjugation by  $Q_{wr}^{-1}$  maps  $U'_{wr}$  to  $U_{wr}$ . We conclude that  $U_{wr} \cong U'_{wr}$ ; so to find the irreducible components of  $U_{wr}$  we just need to find the irreducible components of  $U'_{wr}$ . To clear the context, which is rather cluttered by now, and to avoid writing primes everywhere, we move to a new section.

# 8 Finding the irreducible components of $U_0$

Let X be nilpotent with Jordan basis  $(e_{ij})_{1 \leq i \leq k, 1 \leq j \leq \lambda_i}$ . Let  $V = \{(A_{a,b}, U) : \forall i. A_{a,b}U_{i+1} \subseteq U\}$ . Let

$$U_0 = \{ (A_{0,b}, U) \in V \}.$$

We will find the irreducible components of  $U_0$ .

We write  $b_{ij}$  to denote the projection of  $b \in \mathbb{C}^m$  onto  $e_{ij}$ . For each row i, let  $p_i(b) = \max\{j : b_{ij} \neq 0\}$  (the maximum of the empty set is zero). Then set  $q_i(b) = \lambda_i - p_i(b)$ . When it is clear enough from context, we will just write  $p_i$  and  $q_i$  instead of  $p_i(b)$  and  $q_i(b)$ .

For any  $I' \subseteq \{1,...,k\}$  and any values  $(\rho_i)_{i \in I'}$  such that (1)  $\rho_i \leq \lambda_i$  and (2)  $\rho_i$  is decreasing with i, define

$$U_{I',(\rho_i)} := \{ (A_{0,b}, U) \in U_0 : I' = \{ i : p_i > \max_{j:q_i > q_i} p_j \} \land \forall i \in I'. \ p_i = \rho_i \}.$$

**Lemma 8.1.**  $U_0 = \bigcup_{I',(\rho_i)} U_{I',(\rho_i)}$ , where I' ranges over all possible subsets of  $\{1,...,k\}$ , and  $(\rho_i)$  ranges over all possible maps  $I' \to \mathbb{N}_{>0}$  such that  $\rho_i$  is decreasing as i increases.

*Proof.* Let  $(A_{0,b}, U) \in U_0$ . Define  $I' = \{i : p_i > \max_{j:q_j > q_i} p_j\}$ , and for  $i \in I'$ ,  $\rho_i := p_i$ . All we need to do is show that each  $\rho_i$  is positive and that  $\rho_i$  is decreasing. Then we get that  $(A_{0,b}, U) \in U_{I',(\rho_i)}$ , and we are done.

Recall that by convention we take that the maximum of the empty set is zero. So, the fact that  $\rho_i > \max_{j:q_j > q_i} p_j$  tells us that  $\rho_i$  is positive. Now, let i < i', with  $i, i' \in I'$ . If we had  $p_i \leq p_{i'}$ , then  $q_i \geq q_{i'}$ 

We note that even finding the irreducible components of  $\{A_{0,0}, U \in V\}$  is a pretty hard problem. Not ambitious enough to try to re-solve that problem, we will use its solution.

To find the irreducible components of  $U_0$ , we will use a known result about the irreducible components of the usual Springer fiber at an element  $J(\mu) \in \mathfrak{gl}_{m+n}$ . (I should define this somewhere else, but  $J(\mu)$  just has the blocks in order of nonincreasing size.)

**Theorem 8.2.** (Needs citation!) The irreducible components of the Springer fiber at  $J(\mu)$  are in bijection with the standard Young tableaus of shape  $\mu$ . Further, the irreducible components are equidimensional, of dimension  $\sum_{i\neq j} \min(\mu_i, \mu_j) = \sum_i (i-1)\mu_i$ .

Let  $W_{\mu}$  denote the Springer fiber at  $J(\mu)$ , and let  $(W_{\mu,d})_d$  be the irreducible components. We remark that the Springer fiber at  $PJ(\mu)P^{-1}$  is  $PW_{\mu}$ , and its irreducible components are  $(PW_{\mu,d})_d$ . We will use this result; to find the regular Springer fiber at any  $X \in \mathfrak{gl}_{m+n}$ , we just need to find P such that  $P^{-1}XP$  is in Jordan normal form; equivalently, we just need to find a Jordan basis for X.

So, our strategy will be to find a subset of the possible values of b such that  $A_{0,b}$  has some fixed Jordan form  $\mu$ , and we have an algebraic map  $b \mapsto P_b$  such that for  $A_{0,b}$  in the subset,  $P_b J(\mu) P_b^{-1} = A_{0,b}$ . Then we obtain an irreducible component by picking one of these subsets of the possible values of b and picking a Springer fiber at  $J(\mu)$ .

Finding the map  $b \mapsto P$  amounts to finding a Jordan basis for  $A_{0,b}$ . So, with this as our motivation, we find a Jordan basis for  $A_{0,b}$ .

Normally we index  $e_{ij}$  so that  $\lambda_i$  is nonincreasing with i. Now, it will be more convenient to assume our indices are such that  $q_i$  is nonincreasing, so we will do that: from now on, we assume that  $q_i$  is nonincreasing.

We list the chains of the Jordan basis in (roughly) order of decreasing length. First, for each i such that  $q_i \geq n$ , we take the chain of length  $p_i + q_i$  beginning with  $e_{i,p_i+q_i}$ .

Now we handle  $f_n$ . Let  $P = \max_{i:q_i < n} p_i$ . Set

$$v = f_n - (A^{n+P} f_n >> n + P).$$

Note that  $A^n f_n = b$ , so  $A^{n+P} f_n = A^P b = b \lt \lt P$ . By shifting b left P times, we zero out all the rows i where  $q_i \lt n$ . This ensures that the operation of shifting  $b' \lt \lt P$  right n + P times is invertible by applying A, and thus shifting left, n + P times. So, we take the chain of length n + P beginning with v.

Now, it is clear that each  $f_i$  is in the span of the chains we have listed so far. It is also clear that b << k is in the span, for each  $k \ge 0$ .

Now, we handle the i with  $q_i < n$ . We take as an inductive hypothesis that for all i' < i and all j, we have  $e_{i'j}$  in the span of the chains we have already listed.

If  $p_i \leq \max_{k>i} p_k$ , then we take the chain beginning with  $e_{i,p_i+q_i}$  of length  $p_i + q_i$ . Clearly we then have  $e_{i'j}$  in the span of the chains we have listed, for  $i' \leq i$ .

Otherwise, we set

$$v_i = A^{n-q_i} f_n - \sum_{k=1}^{p_i} b_{i,k} e_{i,k+q_i}.$$

Note that  $A^{q_i}v_i$  is just b with row i zeroed out. Then,  $A^{q_i+\max_{k>i}p_k}v_i$  will have, in addition, rows k zeroed out, for all k>i. This ensures that shifting  $A^{q_i+\max_{k>i}p_k}v_i$  right  $q_i+\max_{k>i}p_k$  times will be inverted by applying A, and thus shifting left,  $q_i+\max_{k>i}p_k$  times. So, we take the chain beginning with  $v_i-(A^{q_i+\max_{k>i}p_k}v_i>>q_i+\max_{k>i}p_i)$ , which has length  $q_i+\max_{k>i}p_k$ .

Now, we want to show that for each j,  $e_{ij}$  is in the span of the chains we've listed so far. Since  $A^{q_i+\max_{k>i}p_k}v_i$  has rows k zeroed out for  $k\geq i$ , our inductive hypothesis tells us that  $A^{q_i+\max_{k>i}p_k}v_i >> q_i+\max_{k>i}p_k$  is in the span of the chains already listed. So it suffices to show that the closure of  $\langle v_i \rangle$  under action by A contains the span of  $e_{ij}$ . And  $A^{n-q_i}f_n$  is also in the span of chains already listed, so it suffices to show that the closure of  $\langle \sum_k b_{ik}e_{i,k+q_i}\rangle$  under action by A contains  $\langle e_{ij}\rangle$ . And this just follows from the fact that  $b_{i,p_i}$  is nonzero.

Now, I've shown that my purported Jordan basis has a large enough span; to show that it is indeed a Jordan basis I just need to count the number of vectors and show that we obtain m + n. I list the purported basis here:

#### • TODO

Indeed, the sum of the lengths is

$$\left[\sum_{i:q_{i} \geq n+r} (p_{i} + q_{i})\right] + (r + n + \max_{i:q_{i} < n+r} p_{i}) + \sum_{i:q_{i} < n+r} \begin{cases} p_{i} + q_{i}, & p_{i} \leq \max_{k > i} p_{k} \\ q_{i} + \max_{k > i} p_{i}, & p_{i} > \max_{k > i} p_{k} \end{cases} =$$

$$\left[ \sum_{i:q_i > n+r} (p_i + q_i) \right] + (r + n + \max_{i:q_i < n+r} p_i) + \sum_{i:q_i < n+r} (q_i + \min(p_i, \max_{k > i} p_i)).$$

Let  $i_1 < \cdots < i_s$  be the 'peaks': that is, the set  $I_1 = \{i : q_i < n + r \land p_i > \max_{k>i} p_k\}$ . (As I should've mentioned before, we take the max of the empty set to be zero.) Let  $I_2 = \{i : q_i < n + r\} \setminus I_1$ . Then

$$\sum_{i:q_i < n+r} (q_i + \min(p_i, \max_{k>i} p_i)) = \sum_{i \in I_2} (p_i + q_i) + \sum_{k=1}^s (q_{i_k} + p_{i_{k+1}}).$$

Clearly then, the whole sum is m+n.

# 9 Finding the irreducible components of a springer fiber at a slodowy slice

Apply things from the previous two sections, and conclude.

### 10 Finding a centralizer

For nilpotent X in Jordan form and a in 'normalized' form (i.e., with at most one nonzero element, which is a one), we will find the centralizer of  $A_{X,a,b}$  in

$$\{(A,I):A\in\mathfrak{gl}_m\}\subseteq\mathfrak{gl}_{m+n}\,.$$

Note that an element of the form (A, I) commutes with  $A_{X,a,b}$  if and only if A commutes with X, and aA = a, and Ab = b. So, we just have to find

$$\{A\in\mathfrak{gl}_m:AX=XA,aA=a,Ab=b\}.$$

We begin by finding

$$\{A \in \mathfrak{gl}_m : AX = XA\}.$$

We write the shape of X as  $\lambda = (\lambda_1, ..., \lambda_k)$ , so that

$$X = \begin{pmatrix} J_{\lambda_1} & & \\ & \ddots & \\ & & J_{\lambda_k} \end{pmatrix}.$$

Then we write A as the block matrix

$$A =: \begin{pmatrix} A_{11} & \cdots & A_{1k} \\ \vdots & & \vdots \\ A_{k1} & \cdots & A_{kk} \end{pmatrix},$$

where  $A_{ij}$  is a block of size  $\lambda_i \times \lambda_j$ . We have

$$XA = \begin{pmatrix} J_{\lambda_1} A_{11} & \cdots & J_{\lambda_1} A_{1k} \\ \vdots & & \vdots \\ J_{\lambda_k} A_{k1} & \cdots & J_{\lambda_k} A_{kk} \end{pmatrix}, \text{ and } AX = \begin{pmatrix} A_{11} J_{\lambda_1} & \cdots & A_{1k} J_{\lambda_k} \\ \vdots & & \vdots \\ A_{k1} J_{\lambda_1} & \cdots & A_{kk} J_{\lambda_k} \end{pmatrix}.$$

So, the constraint that XA = AX is simply saying that

$$\forall i, j. \ J_{\lambda_i} A_{ij} = A_{ij} J_{\lambda_j}.$$

It's easy to see that left multiplication by  $J_{\lambda_i}$  is just a down-shift by one, and right multiplication by  $J_{\lambda_j}$  is a left-shift by one. This means that  $A_{ij}$  is constrained to be a "lower-left-Toeplitz" matrix. A Toeplitz matrix is one which is constant along diagonal bands:  $\forall ijk.\ x_{ij}=x_{i+k,j+k}$ . A lower-left-Toeplitz matrix is one which is all zeroes except for the bottom-left corner; that is, the bands start in the bottom-left corner, and continue until hitting the band which includes the lower-right corner or the band which includes the upper-left corner (whichever comes first). In other words, an  $n \times m$  lower-left-Toeplitz matrix is one which satisfies  $x_{ij}=0$  for all i,j with i < j and all i,j with i-j < m-n. In yet other words, a matrix is lower-left-Toeplitz if it is Toeplitz, satisfies  $x_{1j}=0$  for  $j \neq 1$ , and satisfies  $x_{in}=0$  for  $i \neq m$ . Anyway, it is easy to see that the lower-left-Toeplitz matrices are exactly those matrices A such that left-shifting A by one has the same result as down-shifting by one.

So, we have found the set

$$C_1 := \{ A \in \mathfrak{gl}_m : AX = XA \}.$$

It is just the set of  $A = [A_{ij}]_{ij}$ , where each  $A_{ij}$  is lower-left-Toeplitz. Let  $v_{ij}$  be the leftmost column of  $A_{ij}$ , so that

$$A_{ij} = \left(v_{ij} \stackrel{\checkmark}{\vee} 0 \quad \cdots \quad v_{ij} \stackrel{\checkmark}{\vee} [\lambda_j - 1]\right).$$

Since  $A_{ij}$  is lower-left-Toeplitz,  $v_{ij}$  is of the form

$$v_{ij} = \begin{pmatrix} 0 \\ v'_{ij} \end{pmatrix},$$

where  $v'_{ij} \in \mathbb{C}^{\min(\lambda_i,\lambda_j)}$  can be chosen freely. Now we determine which matrices of this form satisfy aA = a. For simplicity, we will instead find the matrices

A such that aA = 0 (so that a(A + I) = a). (Note that  $I \in C_1$ , and  $C_1$  is closed under addition, so this is really the same thing.)

In the case that a = 0, clearly every A works. Otherwise, let  $i_0, j_0$  be such that  $a_{i_0,j_0} = 1$ . Now, clearly the constraint that aA = 0 is just saying that the  $(i_0, j_0)$ th row of A must be zero. That is, for each j the  $j_0$ th row of  $A_{i_0j}$  must be zero. This just requires that for each j, we must have

$$v_{ij} = \begin{pmatrix} 0 \\ v'_{ij} \end{pmatrix},$$

where  $v'_{ij} \in \mathbb{C}^{\min(\lambda_i - j_0, \lambda_j)}$  can be chosen freely. So, we have now found the set

$$C_2 := \{ A \in \mathfrak{gl}_m : AX = XA, aA = a \}.$$

It is the matrices of the form I + A, where  $A_{ij}$  is a block matrix of size  $\lambda_i \times \lambda_j$  with

$$A_{ij} = T(v_{ij}) = T\begin{pmatrix} 0 \\ v'_{ij} \end{pmatrix},$$

where  $v'_{ij} \in \mathbb{C}^{\min(\lambda_i, \lambda_j)}$  in the case  $i \neq i_0$  and  $v'_{ij} \in \mathbb{C}^{\min(\lambda_i - j_0, \lambda_j)}$  if  $i = i_0$ .

### 11 A Jordan basis for $A_{X,a,b}$

### 11.1 A 'normalization' fact about Jordan bases

Let V be a finite-dimensional vector space,  $A: V \to V$  a nilpotent operator, and  $f: V \to \mathbb{C}$  a linear map. Let  $(e_{ij}: i \leq m, j \leq \lambda_i)$  be a Jordan basis for A.

**Lemma 11.1.** There is a Jordan basis  $e_{ij}$  for A such that there is at most one pair (i, j) with  $f(e_{ij}) \neq 0$ .

*Proof.* For any change of basis  $P: V \to V$  commuting with A, we obtain a new Jordan basis  $(P(e_{ij}): i \leq m, j \leq \lambda_i)$ . For any such P, define

$$S_P = \sum_{i} \begin{cases} -1, & \forall j. \ f \circ P(e_{ij}) = 0 \\ \lambda_i - \min\{j: f \circ P(e_{ij}) \neq 0\}, & \text{otherwise} \end{cases}$$

Let P be any operator, among all invertible operators commuting with A, which minimizes  $S_P$ . Write  $e'_{i,j} := P(e_{i,j})$ .

Suppose for contradiction that there are two distinct i's (and some j's) with  $f(e'_{ij}) \neq 0$ . Then we can take  $e'_{i_1,j_1}$  and  $e'_{i_2,j_2}$ , where for  $k \in \{1,2\}$  we have  $f(e'_{i_k,j_k}) \neq 0$ , and  $\forall j < j_k$ .  $f(e'_{i_k,j}) = 0$ . Wlog, assume  $\lambda_{i_1} - j_1 \leq \lambda_{i_2} - j_2$ . Then, we can define  $Q: V \to V$  by

• 
$$Q(e'_{i_1,\lambda_1}) := e'_{i_1,\lambda_1} - \frac{f(e'_{i_1,j_1})}{f(e'_{i_2,j_2})} e'_{i_2,j_2+(\lambda_{i_1}-j_1)}$$

- For  $j < \lambda_1$ ,  $Q(e'_{i_1,j}) := A^{\lambda_{i_1} j} Q(e'_{i_1,\lambda_{i_1}})$
- For  $i \neq i_1$ ,  $Q(e'_{ij}) = e'_{ij}$ .

Clearly Q is invertible, and it commutes with A. Further, I claim that  $S_{QP} < S_P$ . It suffices to show that  $\forall j \leq j_1$ .  $f \circ Q(e'_{i_1,j}) = 0$ . We have

$$f \circ Q(e'_{i_1,j}) = f\left(A^{\lambda_{i_1}-j}\left(e'_{i_1,\lambda_1} - \frac{f(e'_{i_1,j_1})}{f(e'_{i_2,j_2})}e'_{i_2,j_2+(\lambda_{i_1}-j_1)}\right)\right) =$$

$$f\left(e'_{i_1,j} - \frac{f(e'_{i_1,j_1})}{f(e'_{i_2,j_2})}e'_{i_2,j_2+(j-j_1)}\right) = f(e'_{i_1,j}) - \frac{f(e'_{i_1,j_1})}{f(e'_{i_2,j_2})}e'_{i_2,j_2+(j-j_1)}.$$

Clearly (by design), this expression is zero when  $j = j_1$ . And for  $j < j_1$ , we have  $f(e'_{i_1,j}) = f(e'_{i_2,j_2+(j_2-j_1)}) = 0$ , so it is zero then as well. Thus we see that  $S_{QP} < S_P$ , contradicting that  $S_P$  is minimal. So there must be at most one i such that there exists j such that  $f(e'_{ij}) \neq 0$ .

If there is no such i, we have found the desired basis. So, suppose there is such an  $i_0$ . Let  $U = \langle e'_{i_0,j} \rangle$ . Simply write  $e_j := e'_{i_0,j}$ . Let  $j_0 = \min\{j: f(e_j) \neq 0\}$ . We just have to change basis to zero out  $e_j$  for  $j \neq j_0$ . Let  $P_1(e_{\lambda_{i_0}}) := e_{\lambda_{i_0}} - \frac{f(e_{j_0+1})}{f(e_{j_0})} e_{\lambda_{i_0}-1}$ , and notice that  $f \circ P_1(e_j) = 0$  for all  $j \leq j_0+1$  except for  $j_0$ . Then we define  $P_2(e_{\lambda_{i_0}}) := P_1(e_{\lambda_{i_0}}) - \frac{f \circ P_1(e_{j_0+2})}{f \circ P_1(e_{j_0})} e_{\lambda_{i_0}-2}$ , and notice that  $f \circ P_2(e_j) = 0$  for all  $j \leq j_0+2$  except for  $j_0$ . Eventually we get  $P_{\lambda_{i_0}-j_0}$ , and by applying this to the  $e_j$ 's we obtain a basis of U, in which there is exactly one j with  $f \circ P_{\lambda_{i_0}-j_0}(e_j) \neq 0$ .

#### 11.2 When X is all zeroes

In this case we have  $A(y,z)=(z_nb,(a\cdot y,z_1,...,z_{n-1})),$  and the condition becomes

$$\sum_{i} b_i a_i = 0.$$

In this case we will be able to write down explicitly the irreducible components of  $F:=\{(V,a,b): \forall i.\ A_{X,a,b}V_i\subseteq V_i\}\cong \pi^{-1}(X)$ . For any nonnegative  $\delta_0,\delta_1,...,\delta_n,\delta_{n+1}$  summing to m, define the corresponding sequence  $i_0=\delta_0,$   $i_n=\delta_{n+1}+i_n$ , and for  $j\in\{1,...,n\},\ i_j=i_{j-1}+1+\delta_j$ . Let E be the span of the  $e_i$ 's, and let  $E'=\{(x,0)\in E:x\cdot a=0\}$ , where the dot is the m-dimensional dot product. Then define  $F_\delta$  as the set of  $(V,a,b)\in F$  such that

- $b \in V_{i_0} \subseteq E'$
- for all  $j \in \{1, ..., n\}$ , we have  $f_j \in V_{i_j} \subseteq E' + \langle f_1, ..., f_j \rangle$

I claim that the  $F_{\delta}$ 's are the irreducible components of F. To begin, I show that their union is F.

**Lemma 11.2.** Let  $(V, a, b) \in \mathcal{F}$ . Write  $f_0 = b$ , and  $F = \langle f_0, f_1, ..., f_n \rangle$ . For each i, either  $F \subseteq V_i$ , or else there exists j such that  $e_j \notin V_i$ , but  $\langle e_0, ..., e_{j-1} \rangle \subseteq V_i \subseteq E' + \langle e_1, ..., e_j \rangle$ .

*Proof.* For i = 0, we may take j = 0. Now assume the statement holds for i, and we will prove it for i + 1. If  $F \subseteq V_i$ , then  $F \subseteq V_{i+1}$ , and we are done.

So, suppose there is j such that  $e_j \notin V_i$ , but  $\langle e_0, ..., e_{j-1} \rangle \subseteq V_i \subseteq E' + \langle e_0, ..., e_j \rangle$ . We have two cases: either  $V_{i+1} = V_i + \langle e_j \rangle$ , or not.

- If so, then either j = n, in which case  $F \subseteq V_{i+1}$ , or else  $j \neq n$ , in which case  $e_{j+1} \notin V_{i+1}$ , but  $\langle e_0, ..., e_j \rangle \subseteq V_{i+1} \subseteq E' + \langle e_0, ..., e_{j+1} \rangle$ .
- If not, then  $e_j \notin V_{i+1}$ . Let  $v_{i+1}$  be so that  $V_{i+1} = V_i + \langle v_{i+1} \rangle$ . I just need to show that  $v_{i+1} \in Y + \langle e_1, ..., e_j \rangle$ . It suffices to show that  $v_{i+1}^{\top} e_k = 0$  for k > j. And to do this, it suffices to show that  $(Av_{i+1})^{\top} e_{k-1} = 0$  for k > j.

Note that  $Av_{i+1} \in V_i \cap A\mathbb{C}^{2n} \subseteq \langle e_1,...,e_j \rangle$ . So, for k > j+1 it is clear that  $(Av_{i+1})^{\top}e_{k-1} = 0$ . Now, suppose for contradiction that  $(Av_{i+1})^{\top}e_j \neq 0$ . Then  $Av_{i+1}$  is linearly independent of  $e_1,...,e_{j+1}$ . Since  $Av_{i+1} \in \langle e_1,...,e_j \rangle$ , it follows that  $e_j \in \langle e_1,...,e_{j-1},Av_{i+1} \rangle \subseteq V_i$ , a contradiction.

### Corollary 11.3. $\mathcal{F} = \bigcup_{\delta} \mathcal{F}_{\delta}$

*Proof.* Let  $(V, a, b) \in F$ . Let  $i_0 = \min\{i : b \in V_i\}$ , and let  $i' = \max\{i : V_i \subseteq E'\}$ . We want that  $b \in V_{i_0} \subseteq E'$ , so we want that  $i_0 \le i'$ . For contradiction, suppose  $i' < i_0$ .

**Lemma 11.4.** Each  $\mathcal{F}_{\delta}$  is a closed subvariety of  $\mathcal{F}$ .

$$\square$$

**Lemma 11.5.** Each  $\mathcal{F}_{\delta}$  is irreducible of dimension m.

*Proof.* Let  $\mathcal{E}$  be the variety of partial flags of E of shape  $(\delta_0, ..., \delta_{n+1})$ . Define  $g: \mathcal{F}_{\delta} \to \mathcal{E}$  by

$$(V, a, b) \mapsto 0 \subseteq V_{i_0} \cap E \subseteq V_{i_1} \cap E \subseteq \cdots \subseteq V_{i_{n+1}} \cap E = E.$$

It is clear that g is surjective, as the definition of  $\mathcal{F}_{\delta}$  places no restriction on the intersections  $V_i \cap E$ . Now let's look more closely at the fibers  $g^{-1}(U)$ .

First let's find the flags V such that there exist a, b with g(V, a, b) = U. We see that, for instance,  $V_{i_0} \cap E = U_1$ . In fact  $V_{i_0} \subseteq E$ , so  $V_{i_0} = U_1$ . But we are free to choose the vector spaces between 0 and  $V_{i_0}$  however we wish, so we get some degrees of freedom like  $\mathcal{F}_{\delta_0}$ , the complete flag variety on  $\mathbb{C}^{\delta_0} \cong V_{i_0}/0$ . Similarly, for every j = 1, ..., n+1, we can choose the vector spaces between  $V_{i_{j-1}}$  and  $V_{i_j}$  arbitrarily, so we get degrees of freedom like  $\mathcal{F}_{\delta_{i_j}}$ , the complete flag variety on  $\mathbb{C}^{\delta_{i_j}} \cong V_{i_j}/V_{i_{j-1}}$ . Finally, to meet the constraint of (V, a, b) being in  $\mathcal{F}_{\delta}$ , we can choose any  $b \in U_1$  and any a such that  $\overline{a} \in U_n^{\perp}$ . Thus we get an isomorphism

$$g^{-1}(U) \cong \mathcal{F}_{\delta_0} \times \cdots \times \mathcal{F}_{\delta_{n+1}} \times \mathbb{C}^{\delta_0} \times \mathbb{C}^{\delta_{n+1}}$$

**Theorem 11.6.** The  $\mathcal{F}_{\delta}$ 's are the irreducible components of  $\mathcal{F}$ .

### 11.3 In the case that X is a Jordan block

This case seems harder to work with explicitly than the case that X is zero, so our strategy is to reuse

# 12 A different variety

Define  $R = \{(X, \mathfrak{b}_1, \mathfrak{b}_2) : X \in \mathfrak{b}_1 \wedge u(X) \in \mathfrak{b}_2\} \subseteq \mathcal{S}'_{m,n} \times \mathcal{B}_{m+n} \times \mathcal{B}_m$ . We can obtain a subvariety of R by requiring that u(X) is in some fixed similarity class. (TODO: why is this a subvariety? Is it? Is this even the right way of explaining the significance of the  $m^2$ ?) We expect that each of these subvarieties is an irreducible component of dimension  $m^2$ . We will verify these things using our prvious computations of springer fibers.

#### 12.1 TODO

• Why are SOn flags what they are.
